### ***Trial Summary:***

This is a Phase II, randomized, multi-center, multinational, open-label, cross-over study in adult participants with PD-L1-positive NSCLC. Two populations will be included: participants with resected Stage II, IIIA, and selected IIIB (T3-N2) NSCLC who have completed adjuvant platinum-based chemotherapy without evidence of disease relapse/recurrence, and chemotherapy-naïve participants with Stage IV NSCLC. The study will evaluate participant- and healthcare professionals (HCP)-reported preference for atezolizumab subcutaneous (SC) compared with atezolizumab intravenous (IV).
