CLINICAL STUDY REPORT

Final Clinical Study Report: Study CO40016, (IPATunity130). A Double-Blind, Placebo-Controlled, Randomized Phase III Study of Ipatasertib in Combination with Paclitaxel as a Treatment for Patients with *PIK3CA/AKT1/PTEN*-Altered, Locally Advanced or Metastatic, Triple-Negative Breast Cancer or Hormone Receptor-Positive, HER2-Negative Breast Cancer. Report No. 1120396. August, 2023.

Study Sponsors	F. Hoffmann-La Roche Ltd.
Principal Investigator and Affiliation: Nicholas Turner, MA, MRCP, PhD Breast Unit, The Royal Marsden NHS Foundation Trust London, UK. Breast Cancer Now Research Centre The Institute of Cancer Research London, UK. Rebecca Dent, MSc, MD, FRCP National Cancer Centre; Medical Oncology, 11 Hospital Drive, 0, Singapore, Singapore	**Study Dates:** First Patient Enrolled: 06-Jan-2018 Data cutoff Efficacy analysis: 30-Oct-2021 Safety analysis: 21-Mar-2023 Last Patient Last Visit: 04-Jan-2023
Trial Phase: Phase III	**Indications:** • Triple Negative Breast Cancer • Hormone Receptor Positive, HER2-Negative Breast Cancer

Clinical Study Report Approval Date: See electronic signature on the last page of this document

Personnel Responsible for Clinical and Statistical Analyses:

Study Statistician	Surai Jones
Clinical Scientist	Sarah-Jayne Reilly
Clinical Pharmacologist	Dhruvit Sutaria

GCP Compliance: This study was conducted in accordance with the principles of GCP.

Overall Table of Contents

Table of Contents – Core Report

List of Tables

List of Figures

List of Supporting Data Presentations

LIST OF ABBREVIATIONS AND DEFINITIONS OF TERMS

Abbreviation	Description
ADA	Anti-drug antibody
AE	Adverse event
AESI	Adverse event of special interest
Akt	Protein kinase B
ALT	Alanine aminotransferase
AST	Aspartate aminotransferase
ATP	Adenosine triphosphate
BAR	Bioanalytical report
$C_{1\text{-}3hr}$	Plasma concentration at 1–3 hours post ipatasertib dose
$C_{2–4hr,ss}$	Plasma concentration at 2–4 hours post ipatasertib dose at steady state
$C_{min,ss}$	Trough concentration at steady state
CBR	Clinical benefit rate
CCOD	Clinical cutoff date
COVID-19	Coronavirus disease 2019
CR	Complete response
CRF	Case Report Form
CSR	Clinical study report
DOR	Duration of response
ECG	Electrocardiogram
ECOG PS	Eastern Cooperative Oncology Group Performance Status
eCRF	Electronic Case Report Form
EORTC QLQ-C30	European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire Core 30
GCP	Good Clinical Practice
geoCV%	Geometric mean coefficient of variations
GHS	Global health status
HER2–	Human epidermal growth factor receptor 2-negative
HR	Hazard ratio
HRQoL	Health-related quality of life
HR+	Hormone receptor-positive
ICF	Informed consent form
ICH	International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use
iDMC	Independent Data Monitoring Committee

iEC	Independent ethics committee
IMP	Investigational medicinal product
Ipat	Ipatasertib
IRB	Institutional Review Board
ITT	Intent-to-treat
KM	Kaplan-Meier
LPLV	Last patient last visit
MedDRA	Medical Dictionary for Regulatory Activities
NCI CTCAE	National Cancer Institute Common Terminology Criteria for Adverse Events
ORR	Objective response rate
OS	Overall survival
Pac	Paclitaxel
Pbo	Placebo
PFS	Progression-free survival
PI3K	Phosphoinositide 3-kinase
PI3KCA	Phosphatidylinositol-4,5-bisphosphate 3-kinase, catalytic subunit, alpha
PK	Pharmacokinetic
PR	Partial response
PT	Preferred Term
PRO	Patient-reported outcome
PTEN	Phosphatase and tensin homolog
QoL	Quality of life
QTL	Quality tolerance limit
RECIST	Response Evaluation Criteria in Solid Tumors
SAE	Serious adverse event
SAP	Statistical analysis plan
SD	Standard deviation
SGOT	Serum glutamic-oxaloacetic transaminase
SGPT	Serum glutamic-pyruvic transaminase
SOC	System Organ Class
TNBC	Triple-negative breast cancer
ULN	Upper limit of normal

ETHICS

INDEPENDENT ETHICS COMMITTEE AND/OR INSTITUTIONAL REVIEW BOARD

- The protocol, protocol amendments, informed consent form (ICF), Investigator Brochure, and other relevant documents (e.g., advertisements) were submitted to an Institutional Review Board (IRB)/Independent Ethics Committee (IEC) by the investigator and reviewed and approved by the IRB/IEC before the study was initiated.
- Any amendments to the protocol required IRB/IEC approval before implementation of changes made to the study design, except for changes necessary to eliminate an immediate hazard to study patients.

ETHICAL CONDUCT OF THE STUDY

This study was conducted in accordance with the protocol and with the following:

- Consensus ethical principles derived from international guidelines including the Declaration of Helsinki and Council for International Organizations of Medical Sciences International Ethical Guidelines
- Applicable International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH) Good Clinical Practice (GCP) Guidelines
- Applicable laws and regulations

PATIENT INFORMATION AND CONSENT

- The investigator or his/her representative explained the nature of the study to the patient or his/her legally authorized representative and answered all questions regarding the study.
- Patients were informed that their participation was voluntary. Patients or their legally authorized representative were required to sign a statement of informed consent that met the requirements of 21 Code of Federal Regulations 50, local regulations, ICH guidelines, Health Insurance Portability and Accountability Act requirements, where applicable, and the IRB/IEC or study center.
- The medical record included a statement that written informed consent was obtained before the patient was enrolled in the study and the date the written consent was obtained. The authorized person obtaining the informed consent also signed the ICF.
- Patients were re-consented to the most current version of the ICF(s) during their participation in the study.
- A copy of the ICF(s) was provided to the patient or the patient's legally authorized representative.

Institutional Review Boards (IRBs) and/or Independent Ethics Committee (IECs) approval	Protocol v11, Section 8.3. A list of IRBs and IECs is provided. See note below.
Compliance with laws and regulations	Protocol v11, Section 8.1.
Informed Consent procedures	Protocol v11, Section 8.2.

1. INTRODUCTION

Globally, breast cancer is the second most common invasive malignancy and the most common cause of cancer-related mortality in women, with a 5-year survival rate following metastatic diagnosis of approximately 15% (Jemal et al. 2011; Ferlay et al. 2015).

Triple-negative breast cancer (TNBC) accounts for approximately 20% of all breast cancers and patients with metastatic TNBC exhibit a particularly poor clinical outcome, generally with rapid progression and a median overall survival (OS) rate of approximately 16 months (Rodler et al. 2010; Miles et al. 2013). At the time that Study CO40016 was initiated, there were no approved first-line regimens or targeted therapies for patients with this specific subtype of breast cancer. Paclitaxel was considered an appropriate first-line regimen, with a median progression-free survival (PFS) of approximately 6 months in patients with TNBC (Miles et al. 2013; Miles et al. 2017).

Hormone receptor–positive, human epidermal growth factor receptor 2-negative breast cancer (hereinafter referred to as HR+/HER2– breast cancer) accounts for over 70% of all breast cancers. Chemotherapy is indicated in patients with symptomatic visceral disease (visceral crisis) or with disease progression after demonstration of endocrine resistance (Cardoso et al. 2017; [NCCN] National Comprehensive Cancer Network 2017). Patients with HR+/HER2– breast cancer receiving first-line chemotherapy with paclitaxel had a median PFS of approximately 7–8 months in recent studies (RIBBON-1, Robert et al. 2011; PEGGY, Vuylsteke et al. 2016). As with TNBC, at the time that Study CO40016 was initiated, there was no clear standard or defined treatment regimen for patients with metastatic HR+/HER2– breast cancer who have progressed after endocrine therapy; in particular, effective treatment is needed for patients when continued endocrine therapy is not indicated.

Ipatasertib is a potent, highly selective small-molecule inhibitor of all three isoforms of the serine/threonine kinase Akt. Ipatasertib binds to the activated conformation of Akt and is adenosine trisphosphate competitive. Ipatasertib binding inhibits the kinase activity of Akt and suppresses the phosphorylation of its direct substrates, including PRAS40, and additional downstream targets, such as S6 ribosomal protein, resulting in G_1 arrest and/or apoptosis in human cancer cells (Lin et al. 2012).

Based on the scientific rationale that phosphoinositide 3-kinase/protein kinase B (PI3K/Akt) blockade attenuates survival signals associated with mitotic stress from treatment with microtubule inhibitors and the high prevalence of PI3K/Akt pathway activation signatures in TNBC and in HR+/HER2– tumors (Cancer Genome Atlas Network 2012), clinical trials evaluating the preliminary safety and efficacy of the combination of ipatasertib and paclitaxel in patients with breast cancer have been conducted and have shown the benefit of ipatasertib in patients with phosphatidylinositol-4, 5–bisphosphate 3-kinase, catalytic subunit α/AKT1/phosphatase

and tensin homolog (PIK3CA/AKT1/PTEN)-altered tumors (Interim Clinical Study Report 2017; Final Clinical Study Report 2020).

Study CO40016 was a Phase III, double−blind, placebo−controlled study designed to assess ipatasertib in combination with paclitaxel as a treatment for patients with locally advanced unresectable or metastatic TNBC or HR+/HER2− breast cancer.

Study CO40016 had three cohorts:

- Cohort A was designed to evaluate first-line treatment with ipatasertib plus paclitaxel (Ipat+Pac) in patients with locally advanced unresectable or metastatic TNBC with *PIK3CA/AKT1/PTEN*-altered tumors.
- Cohort B was designed to evaluate Ipat+Pac in patients with HR+/HER2− breast cancer with *PIK3CA/AKT1/PTEN*-altered tumors and no prior chemotherapy in the advanced disease setting, and who were suitable for chemotherapy (as defined in the protocol).
- Cohort C was an open-label, non-randomized cohort for patients with locally advanced unresectable or metastatic TNBC which lacks *PIK3CA/AKT1/PTEN* alteration to evaluate ipatasertib in combination with atezolizumab and paclitaxel (Ipat+Atezo+Pac).

Summary of Primary Analysis Results for Cohort A and Cohort B

The primary analyses were performed for Study CO40016 Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941) based on the clinical cutoff dates (CCOD) of 7 May 2020 and 17 January 2020, respectively. Overall, both cohorts did not meet their primary efficacy endpoint (investigator-assessed PFS). For Cohorts A and B, a similar proportion of patients in both arms had progressed or died in the intent-to-treat (ITT) population (Cohort A, Ipat+Pac: 54.8% vs. Pbo+Pac: 55.2%; Cohort B, Ipat+Pac: 68.5% vs. Pbo+Pac: 69.7%).

For both Cohorts A and B, data for the interim analysis of the key secondary efficacy endpoint of OS was immature at the primary analysis CCOD. For Cohort A, a similar proportion of deaths had occurred in the Ipat+Pac arm and Pbo+Pac arm and the stratified hazard ratio (HR) was 0.99 (95% CI: 0.54, 1.80). The Kaplan-Meier (KM) estimated median OS was not reached in the Ipat+Pac arm and was 21.9 months (95% CI: 16.0, NE) in the Pbo+Pac arm. For Cohort B, more deaths were reported in the Pbo+Pac arm compared with the Ipat+Pac arm, and the stratified HR was 0.72 (95% CI: 0.42, 1.24). The KM-estimated median OS was not reached in the Ipat+Pac arm and was 20.9 months (95% CI: 17.3, NE) in the Pbo+Pac arm.

In both cohorts, results of other secondary efficacy endpoints (e.g., investigator-assessed objective response rate [ORR], duration of response [DOR], and clinical benefit rate [CBR]) were consistent with those of the primary endpoint of PFS, with no clinically meaningful benefit observed for ipatasertib in combination with paclitaxel over paclitaxel alone.

Overall, ipatasertib in combination with paclitaxel was well tolerated, and the safety profile of the combination treatment regimen was consistent with the known risks of each individual study treatment component. No new safety signal was identified.

On 15 September 2021, a memo was released to investigators that the decision was made to reduce the burden of study assessments for patients and sites, with 30 October 2021 defined as the final CCOD for the efficacy analyses; no efficacy data were analyzed after this date. Last Patient Last Visit (LPLV) for this study took place on 4 January 2023. For the purposes of this final Clinical Study Report (CSR), a snapshot date of 21 March 2023 was utilized for safety analyses (also used for other analyses such as study population, etc.). It is provided in an abbreviated format because ipatasertib in combination with either paclitaxel alone (i.e., Cohorts A and B) or with atezolizumab and paclitaxel (i.e., Cohort C) is no longer being pursued for use in patients with *PIK3CA/AKT1/PTEN*-altered, locally advanced or metastatic TNBC or HR+/HER2- breast cancer.

In consideration of the coronavirus disease 19 (COVID-19) pandemic, details of the Sponsor's assessment of the impact of COVID-19 on data collection, reporting and analysis for all cohorts are provided in the Covid19 Annex. Overall, the COVID-19 pandemic had minor impact on the study conduct, data collection and analyses.

2. OBJECTIVES AND ENDPOINTS

Sections 2–3 of this final CSR have been populated using Study CO40016 Protocol Version 11 (v11), and as such they contain information that is pertinent to all three cohorts. The objectives and corresponding endpoints for Cohort A and B were presented in the primary CSRs for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941).

The objectives and corresponding endpoints for Cohort C are presented in Table 1. Since ipatasertib in combination with paclitaxel or with atezolizumab and paclitaxel in patients with *PIK3CA/AKT1/PTEN*-altered, locally advanced or metastatic TNBC or HR+/HER2– breast cancer is no longer being pursued, the exploratory objectives and results from these analyses are not presented in the CSR.

The complete list of objectives and corresponding endpoints are provided in study Protocol v11, Section 2.

Table 1 Objectives and Corresponding Endpoints (Cohort C)

Objectives	Corresponding Endpoints
Primary Efficacy Objective	
• To evaluate the efficacy of ipatasertib + paclitaxel + atezolizumab	• PFS, defined as the time from enrollment to the first occurrence of disease progression, as determined locally by the investigator through the use of RECIST v1.1, or death from any cause, whichever occurs first
Secondary Efficacy Objectives	
• To evaluate the efficacy of ipatasertib + paclitaxel + atezolizumab	• Objective response rate, defined as a CR or PR on two consecutive occasions ≥ 4 weeks apart, as determined locally by the investigator through the use of RECIST v1.1 • Duration of response, defined as the time from the first occurrence of a documented objective response to disease progression, as determined locally by the investigator through use of RECIST v1.1, or death from any cause, whichever occurs first • Clinical benefit rate, defined as an objective response (CR or PR), or stable disease for at least 24 weeks, as determined locally by the investigator through the use of RECIST v1.1 • OS, defined as the time from enrollment to death from any cause • 1-year PFS, defined as progression-free survival probabilities at 1 year • 1-year OS, defined as overall survival probabilities at 1 year
• To evaluate PROs of GHS/QoL associated with ipatasertib + paclitaxel + atezolizumab	• Mean and mean changes from baseline GHS/QoL score as measured by the GHS/QoL scale (Questions 29 and 30) of the EORTC QLQ-C30, by cycle

Table continued from previous page

Safety Objective	
• To evaluate the safety of ipatasertib + paclitaxel + atezolizumab	• Incidence of adverse events as assessed by the investigator, with severity determined through the use of NCI CTCAE v4.0 • Incidence of prespecified adverse events • Change from baseline in targeted vital signs • Change from baseline in targeted clinical laboratory test results
Pharmacokinetic Objective	
• To characterize the pharmacokinetics of atezolizumab, ipatasertib and its metabolite (G-037720) when administered in combination with paclitaxel	• Plasma concentration of ipatasertib and its metabolite, G-037720 at specified timepoints for analysis using population PK methodology • Serum concentration of atezolizumab at specified timepoints
Immunogenicity Objective	
• To evaluate the immune response to atezolizumab	• Incidence of ADAs to atezolizumab during the study relative to the prevalence of ADAs at baseline

ADA = anti-drug antibody; CR = complete response; EORTC QLQ-C30 = European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire Core 30; GHS = global health status; NCI CTCAE v4.0 = National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.0; OS = overall survival; PK = pharmacokinetics; PFS = progression-free survival; PR = partial response; PRO = patient-reported outcome; QoL = Quality of life; RECIST v1.1 = Response Evaluation Criteria in Solid Tumors, Version 1.1.

3. INVESTIGATIONAL PLAN

3.1 OVERVIEW OF STUDY DESIGN

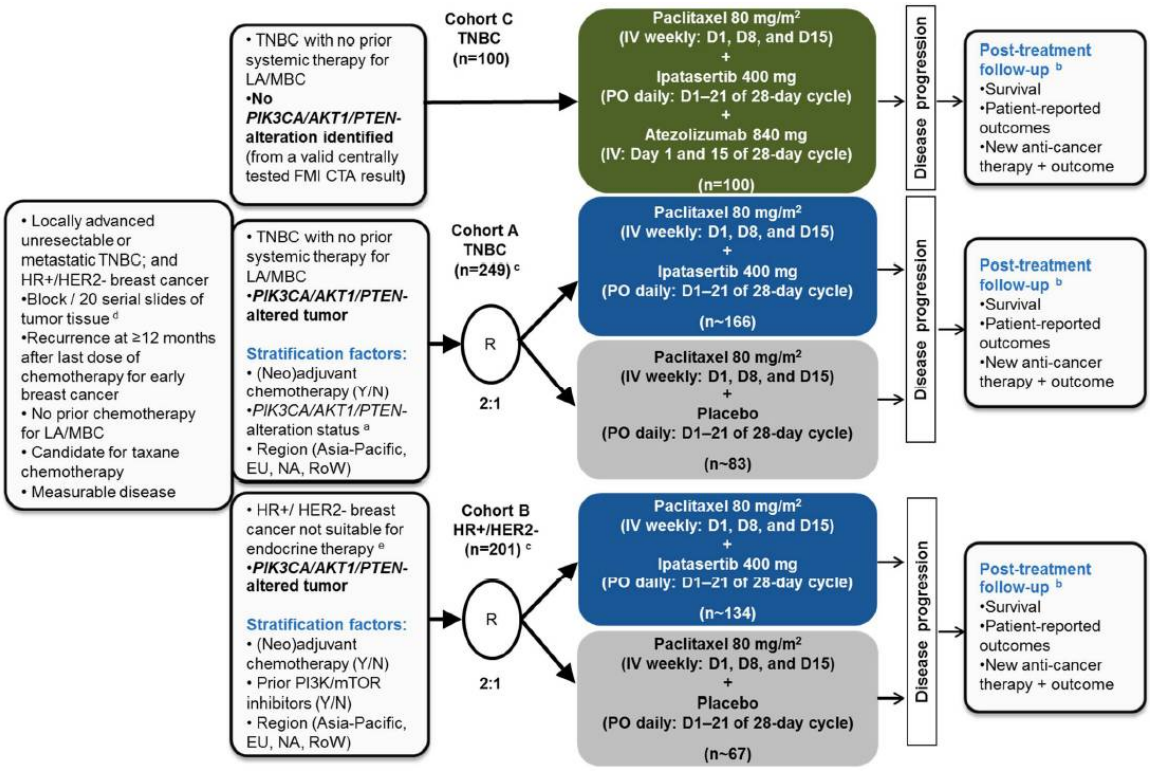
An overview of the study design, including information on the patient screening, allocation, and stratification process, treatment regimens and follow-up assessments, determination of tumor *PIK3CA/AKT1/PTEN*-altered and hormone receptor status, tumor assessments and measurements for disease evaluation, as well as efficacy, safety, and pharmacokinetic (PK) evaluation, data analysis methodology, and schedules of study assessments is provided in the Protocol v11, Section 3.1.1. The study design is depicted in Figure 1.

End of Study and Length of Study

The end of this study was defined as the date when the LPLV occurred or the date at which the last data point required for statistical analysis or safety follow-up was received from the last patient, whichever occurred later. In addition, the Sponsor could have

decided to terminate a cohort or the study at any time. The total length of the study, from screening of the first patient to the end of the study, was approximately 62 months.

Figure 1 Study Design



BC = breast cancer; CTA = clinical trial assay; D = day; EU = Europe; FMI = Foundation Medicine Inc.; HER2 = human epidermal growth factor receptor 2; HR = hormone receptor; IV = intravenous; LA = locally advanced unresectable; MBC = metastatic breast cancer; n = number of patients; NA = North America; PIK3CA = phosphatidylinositol-4,5-bisphosphate 3-kinase catalytic subunit alpha; PO = by mouth; PTEN = phosphatase and tensin homolog; R = randomization; RoW = Rest of the World; TNBC = triple-negative breast cancer; Y/N = yes or no.

Note: If allowed locally, prophylaxis loperamide was mandated in Cycle 1, dose adjustment was as necessary, and continuation was per investigator judgment.

[a] *PIK3CA/AKT1* mutant versus *PTEN*-altered (and non-*PIK3CA/AKT1* mutant).

[b] If applicable, patients returned to the clinic every 8–12 weeks for tumor assessments (disease follow-up visit) until disease progression, elective withdrawal from study, or study completion or termination. As of Protocol CO40016 Version 11 (Cohort C), follow-up tumor assessments were no longer required.

[c] As needed to potentially support a regulatory submission in China, additional Chinese patients may be subsequently enrolled at CFDA-recognized sites in an extended enrollment phase (China extension phase), for up to a total of 90 Chinese patients with TNBC with *PIK3CA/AKT1/PTEN*-altered tumors and up to 120 Chinese patients with HR+/HER2– breast cancer with *PIK3CA/AKT1/PTEN*-altered tumors, constituting the analysis population of the China subgroup (including Chinese patients enrolled in the global enrollment phase).

[d] A lower number of slides may have been required if FoundationONE CDx™ was commercially already run and used for biomarker qualification.

[e] Patients with HR+/HER2– breast cancer who were not suitable candidates for endocrine therapy (as defined by Sponsor; see eligibility criteria) and who met one of the following criteria: the patient had recurrent disease (locoregional or metastatic) during adjuvant endocrine therapy

(i.e., ≤5 years of being on therapy), or if the patient had de novo metastatic disease, patient had progressive disease within 6 months of being on first-line endocrine treatment of metastatic disease.

3.1.1 Discussion of Study Design

The scientific rationale for features of the study design, including chosen control group(s), dose(s), and endpoint(s), as applicable, are discussed in the Scientific Rationale for Study Design section of the Protocol v11, Section 3.3.

3.1.2 Changes in Study Conduct

Key updates for each protocol amendment from v2 to v7 (including Germany specific amendments) for Cohorts A and B and from v7 to v9 for Cohort C were summarized in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941).

Key updates (details for all updates are provided in the relevant appendix) for each protocol amendment since then are summarized below.

Version 8 of the protocol (dated February 2021), Version 9 (Germany; dated February 2021) and Version 10 (Cohort C Countries; dated February 2021)

- Language has been amended to indicate that images for tumor assessments will no longer be collected for blinded independent central review.
- Changes that were specific to Cohort C were:
  - Definitions of secondary efficacy endpoints have been updated to clarify that these are based on PFS or OS at 1 year after enrollment for Cohort C.
  - Language has been updated to allow follow-up tumor assessments in Cohort C to be performed every 8–12 weeks (in alignment with Cohorts A and B).

An end-of-trial notification for Germany occurred under Protocol v9 (Germany).

Version 9 of the protocol (dated February 2022) and Version 11 (Cohort C Countries, dated February 2022)

- Language added to allow Tumor Assessments to be performed per standard of care to reduce burden on patients.
- Language added to remove the requirement for assessments in long-term follow-up.

3.2 INVESTIGATORS AND STUDY ADMINISTRATIVE STRUCTURE

An independent Data Monitoring Committee (iDMC) periodically evaluated the safety of ipatasertib or placebo combined with paclitaxel (Cohorts A and B). The analysis supporting iDMC review was conducted by an independent Data Coordinating Center and provided to the iDMC. Interactions between the iDMC and Sponsor were carried out as specified in the iDMC Charter, which has been unchanged since the primary CSRs

for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). Safety monitoring was performed by the Sponsor for Cohort C.

3.3 SELECTION OF STUDY POPULATION

3.3.1 Inclusion/Exclusion Criteria

In Study CO40016, Cohort A and B included patients with histologically confirmed locally advanced unresectable or metastatic TNBC or HR+/HER2− adenocarcinoma of the breast, respectively, with *PIK3CA/AKT1/PTEN* alteration and no prior systemic chemotherapy in the advanced disease setting and who were candidates for taxane monotherapy. Cohort C included patients with histologically confirmed locally advanced unresectable or metastatic TNBC without *PIK3CA/AKT1/PTEN*-altered tumors and no prior systemic chemotherapy in the advanced disease setting.

Detailed inclusion and exclusion criteria are provided in the Protocol v11, Section 4.1.1 and 4.1.2, respectively.

3.3.2 Removal of Patients from Treatment or Study

The specific criteria and procedures for early discontinuation from study treatment(s) or withdrawal from the study are described in the Protocol v11, Sections 4.6.

3.4 STUDY TREATMENTS

3.4.1 Study Treatment(s) Administered

The investigational medicinal products (IMPs) for this study were ipatasertib (all Cohorts), matching placebo (Cohorts A and B), atezolizumab (Cohort C), and, dependent on local regulations, paclitaxel. Paclitaxel is an approved treatment for breast cancer and is considered standard of care in some countries. Loperamide (racecadotril as used in Europe) was a non-IMP in the study.

The treatment regimens are summarized in the Protocol v11, Section 3.1. The sequence of drug administration was ipatasertib/placebo, then atezolizumab (only for patients in Cohort C), and then paclitaxel. On non-atezolizumab administration days (Cohort C), the sequence of drug administration was ipatasertib and then paclitaxel.

Any dose modification had to be noted on the Study Drug Administration electronic Case Report Form (eCRF). Cases of overdose, medication error, drug abuse, or drug misuse, along with any associated adverse events (AEs), had to be reported as described in the Protocol v11, Section 5.3.5.12.

Guidelines for dosage modification and treatment interruption or discontinuation for patients who experience AEs are provided in the Protocol v11, Section 5.1.5.

Details regarding continued access to ipatasertib and atezolizumab have been presented in the Protocol v11, Section 4.3.5.

The manufacturing lot numbers for the study treatment(s) available to be dispensed in this study are provided in Appendix 16.1.6.

3.4.1.1 Dosage and Administration

Details on the study treatment dosage and administration for ipatasertib/placebo, atezolizumab, and paclitaxel are provided in Protocol v11, Section 4.3.2.

3.4.1.2 Formulation and Packaging

Details on the study treatment formulation and packaging for ipatasertib/placebo, atezolizumab, and paclitaxel are provided in Protocol v11, Section 4.3.1.

3.4.2 Measures to Minimize Bias

Method of Treatment Assignment and Blinding

There were three cohorts in this study (Figure 1). The first two cohorts, A and B, were randomized, double-blind, placebo-controlled cohorts in biomarker-positive populations designed to estimate the effect on PFS of the addition of ipatasertib to paclitaxel compared with placebo plus paclitaxel. The third cohort, Cohort C, had a single-arm open-label design to test safety and efficacy of the combination of ipatasertib plus atezolizumab plus paclitaxel in a biomarker-negative population.

The methods used to assign/allocate patients to treatment(s) groups, including any stratification factors, if applicable, and for blinding/masking for Cohorts A and B are described in Protocol v11, Section 4.2.

3.4.3 Study Treatment Accountability and Compliance

The methods used to assess study treatment compliance are described in the study treatment compliance section of the Protocol v11, Section 4.3.2.

Details on investigational medicinal product accountability are provided in Protocol v11, Section 4.3.4.

3.4.4 Prior and Concomitant Therapy

Concomitant therapy consisted of any medication (e.g., prescription drugs, over-the-counter drugs, vaccines, herbal or homeopathic remedies, nutritional supplements) used by a patient in addition to protocol-mandated treatment from 14 days prior to initiation of study drug to the study drug discontinuation visit. All such medications had to be reported to the investigator and recorded on the Concomitant Medications eCRF.

The details regarding permitted therapy, cautionary therapy, prohibited therapy, prohibited food, and additional restrictions have been presented in the Protocol v11, Section 4.4. Details on other treatments relevant to the study design (e.g., premedication and prophylactic treatment) are provided in the Protocol v11, Section 4.3.3.

3.4.5 Criteria for Dose Modification

General guidelines and details for dose modification and treatment interruption or discontinuation are provided in Protocol v11, Section 5.1.5.

Any dose modification was to be noted on the corresponding Study Drug Administration eCRF. Cases of accidental overdose or medication error, along with any associated AEs, were to be reported as described in Protocol v11, Section 5.3.5.12.

3.5 STUDY ASSESSMENTS AND PROCEDURES

The schedule of activities performed for all cohorts during the study is provided in Protocol v11, Appendix 1 (Schedule of Activities: Cohorts A and B), Appendix 2 (Schedule of Activities: Cohort C), Appendix 3 (Schedule of Pharmacokinetic and Immunogenicity Samples: Cohorts A and B), and Appendix 4 (Schedule of Pharmacokinetic and Immunogenicity Samples: Cohort C).

Patients were closely monitored for safety and tolerability throughout the study. Patients were assessed for toxicity prior to each dose; dosing occurred only if the clinical assessment and local laboratory test values were acceptable.

3.5.1 Planned Measurements and Timing of Assessments

Full details on the specific efficacy, safety, PK, immunogenicity, and biomarker assessments, their schedule and measurement/collection methods for all cohorts are provided in the Schedule of Assessments and described in Protocol v11, Section 4.5. The collection and assessment of safety information during the study (evaluation, definitions, recording, and reporting of AEs, serious adverse events [SAEs] and other reportable safety events) is detailed in the AE reporting section of the Protocol v11, Section 5.

3.6 DATA QUALITY ASSURANCE

Data Quality Assurance and Data Collection and Management	Protocol v11, Section 7. The blank eCRF is provided.
Audits and Good Clinical Practice (GCP) compliance	See statements of GCP compliance under Ethics and the audit certificate
Roche Clinical Quality Assurance	See the detailed audit summary.

No new audits were conducted for this study since the last Audit Certificate and Audit Summary issued in April 2020 and reported in the primary CSRs for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941).

A Quality Tolerance Limit (QTL) Plan was implemented retrospectively for Cohort A of this study. A summary of QTL deviations and remedial actions for Cohort A only can be found in the Appendix 16.1.13 (Quality Tolerance Limit Deviations and Remedial Actions). Overall, there was no impact to the conduct of the study.

3.7 DATA ANALYSIS PLAN

The Statistical Analysis Plan (SAP) v1 was approved on 6 February 2020 and SAP v2 was approved on 12 March 2020.

All details of the statistical analyses and determination of sample size for Study CO40016 Cohorts A and B are described in the final version of the SAP v2 and supersede those specified in the study protocol, where applicable. Cohort C was an open-label single-arm cohort, therefore the analysis plan for Cohort C is provided in Protocol v11, Section 6.

The three cohorts, Cohort A (TNBC biomarker-positive), Cohort B (HR+/HER2– biomarker-positive breast cancer), and Cohort C (TNBC biomarker-negative) were three independent cohorts and were analyzed separately for the following reasons:

- The three patient populations were distinct patient populations and were expected to have different prevalence and PFS and OS expectations, and thus different enrollment and analysis timelines.
- The readout from one cohort was independent of the readout of the other cohorts.
- This study was essentially three independent trials running under one protocol for operational efficiency.

Further details on statistical considerations and analysis plan for all cohorts are provided in Protocol v11, Section 6.

3.7.1 Statistical Hypothesis and Planned Sample Size

3.7.1.1 Statistical Hypothesis

For details on the statistical hypothesis and analysis plan for Cohort A and B, please refer to the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), respectively, the SAP v2, Section 4, and Protocol v11, Section 6. Cohort C was a single-arm cohort with no statistical hypothesis testing and the results are descriptive only.

3.7.1.2 Planned Sample Size

For Cohort A, approximately 249 patients with TNBC with *PIK3CA/AKT1/PTEN*-altered tumors were to be enrolled and randomized in a 2:1 ratio to the experimental arm (ipatasertib 400 mg + paclitaxel) and control arm (placebo + paclitaxel). The sample size of 249 patients was determined on the basis of the power calculation for the PFS and OS endpoints.

For Cohort B, approximately 201 HR+/HER2– patients with *PIK3CA/AKT1/PTEN*-altered tumors were to be enrolled and randomized in a 2:1 ratio to the experimental arm (ipatasertib 400 mg + paclitaxel) and control arm (placebo + paclitaxel). The sample size of 201 patients was determined on the basis of the power calculation for the primary endpoint, PFS.

For Cohort C, approximately 100 patients with TNBC lacking *PIK3CA/AKT1/PTEN*-altered tumors were to be enrolled and assigned to a single arm of ipatasertib plus atezolizumab plus paclitaxel. The sample size of 100 patients was determined on the basis of having a sufficient number of patients for efficacy signal seeking, as well as adding to current knowledge on the safety profile of this combination, and not delaying the enrollment of patients with TNBC for Cohorts A and C.

Further details on the determination of sample size for all cohorts in Study CO40016 are provided in Protocol v11, Section 6.1.

3.7.2 Analysis Populations

Randomized/ITT Population

The randomized population, which was also referred as the ITT population, was defined as all randomized patients in Cohorts A and B regardless of whether the patient received the assigned treatment. For Cohort C, the ITT population consisted of all enrolled patients in Cohort C. All efficacy analyses were performed in the ITT population, unless otherwise specified.

Safety Population

The safety population was defined as patients who received any amount of study treatment. All safety analyses were performed in the safety population, unless otherwise specified. Patients were analyzed according to the treatment group associated with the actual regimen received. Patients who were randomized (Cohorts A and B) or enrolled (Cohort C) into the study but who did not receive any study drug were not included in the safety population.

PRO Evaluable Population

The patient-reported outcome (PRO)-evaluable population included all randomized (Cohorts A and B) or enrolled (Cohort C) patients who had a baseline and at least 1 postbaseline PRO assessment. The PRO-evaluable patients were analyzed according to the treatment arm assigned at randomization by interactive voice/web response system (Cohorts A and B) and to the treatment received (Cohort C).

Analyses for PRO efficacy endpoints were performed in the PRO evaluable population, unless otherwise specified.

3.7.3 Efficacy Analysis

All efficacy analyses were based on the ITT population (see Analysis Populations) according to the treatment arm to which patients were allocated and DOR analysis included all patients with an objective response.

All primary and secondary endpoints based on tumor burden were based on radiological (or photographical, if applicable) assessments by the local radiologist or investigator.

3.7.3.1 Primary Efficacy Analysis

The primary efficacy endpoint was investigator-assessed PFS, defined as the time from randomization (Cohorts A and B) or enrollment (Cohort C) to the first occurrence of disease progression, as determined by the investigator using Response Evaluation Criteria in Solid Tumors, Version 1.1 (RECIST v1.1), or death from any cause, whichever occurred first. Data for patients who did not experience disease progression or death were censored at the last date of evaluable tumor assessment. For patients who did not have an evaluable tumor assessment after randomization/enrollment, the data were censored at the date of randomization plus 1 day.

For further details, refer to SAP v2, Section 4.4.1 and Protocol v11, Section 6.4.1.

3.7.3.2 Key Secondary Efficacy Analysis

Overall survival was a key secondary efficacy endpoint and was tested only if the primary analysis of respective PFS in the corresponding cohort reached statistical significance at the level of 5%.

Overall survival was defined as the time from randomization (Cohorts A and B) or enrollment (Cohort C) to death from any cause. Data for patients who were not reported as having died at the time of analysis were censored at the date when they were last known to be alive. Data for patients who did not have postbaseline information were censored at the randomization (Cohorts A and B) or enrollment (Cohort C) date plus 1 day.

For further details, refer to SAP v2, Section 4.4.2 and Protocol v11, Section 6.4.2.3.

3.7.3.3 Other Secondary Efficacy Analysis

For all cohorts, secondary efficacy endpoints included ORR with DOR and CBR. The data analysis plan for these secondary efficacy endpoints for Cohorts A and B were previously described in the SAP v2, Section 4.4.3 and the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). The data analysis plan presented below is applicable to Cohort C.

Objective response rate was defined as the proportion of patients who had an objective response. For each cohort, an estimate of ORR was calculated for each treatment arm, and its 95% CI was calculated using the Blyth-Still-Casella method.

Duration of response was defined as the time from the first occurrence of a documented objective response to disease progression, as determined by the investigator through the use of RECIST v1.1, or death from any cause, whichever occurred first. The censoring method for DOR was the same as that for PFS. For each cohort, the KM approach was used to estimate the median DOR and the corresponding 95% CIs. Analysis of DOR included only patients with objective responses. Because of the

non-randomized nature of this analysis population, the analysis of DOR was considered descriptive.

Clinical benefit rate was defined as the proportion of patients who had an objective response (complete response [CR] or partial response [PR]), or stable disease for at least 24 weeks, as determined by the investigator through the use of RECIST v1.1. For each cohort, CBR was analyzed using methods similar to those used for ORR.

Additional secondary efficacy endpoints specific to Cohort C included 1-year PFS and 1-year OS rate. They were estimated using the KM method and their 95% CIs were provided using Greenwood's formula.

For further details, refer to SAP v2, Section 4.4.3 and the Protocol v11, Section 6.4.2.1 (ORR with DOR), Section 6.4.2.2 (CBR), and Section 6.4.2.4 (1-Year PFS and 1-Year OS Rate [Cohort C only]).

Patient-Reported Outcome Analyses

The European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire Core 30 (EORTC QLQ-C30) (version 3) data were scored according to the EORTC scoring manual (Fayers et al. 2001). Missing data were assessed and reported by cycle. In the event of incomplete data, if the scale had more than 50% of the constituent items completed, a pro-rated score was computed consistent with the scoring manual and validation papers of the measure. For subscales with less than 50% of the items completed, the subscale was considered missing.

Completion rates of the EORTC QLQ-C30 in the ITT population of Cohort C were summarized by number and proportion of patients among those expected to complete the QLQ-C30 at each time point. Reasons for non-completion were summarized at each time point for Cohort C.

Secondary Patient-Reported Outcome Endpoint: Patient-Reported Outcomes of Global Health Status/Quality of Life – EORTC Data

Details on the PRO analysis plan for Cohorts A and B were provided in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). Details on the PRO analysis plan for Cohort C is provided below.

A secondary patient-reported endpoint was mean and mean changes from baseline score of global health status/quality of life (GHS/QoL). Summary statistics (number of patients, mean, standard deviation [SD], 95% CIs, median, and range) of linearly transformed absolute scores and mean changes from baseline were calculated for the GHS/QoL (Q29 and Q30) scale of the EORTC QLQ-C30 at each assessment time point within Cohort C, in the PRO-evaluable population. Line charts depicting the mean changes (and 95% confidence intervals) from the baseline assessment of GHS/QoL

over time were also provided. A 10-point change was used to identify clinically meaningful change from baseline on the GHS/QoL scale (Osoba et al. 1998).

3.7.4 Safety Analysis

All safety analyses were based on the safety evaluable population for each cohort (see Analysis Populations) according to the treatment received.

Safety analyses were conducted by treatment arms for Cohorts A and B, and by treatment received in Cohort C, and included frequency, nature, and severity of treatment-emergent AEs, including AEs leading to death, SAEs, and AEs of special interest (AESI). All deaths were summarized. In addition, AEs leading to study drug discontinuation and dose modification were summarized. Laboratory measurements outside of the normal range were identified. Selected laboratory data were summarized by treatment arm and grade compared with baseline. Relevant vital signs were presented using summary statistics by treatment arm and visit. Drug exposure was summarized as well, including duration of treatment, cumulative dose, and dose intensity.

After initiation of study drug, SAEs and AESIs were reported until 28 days after the final dose of study treatment or until initiation of new systemic anti-cancer therapy, whichever occurred first (Cohorts A and B), or for patients in Cohort C, all AEs were reported until 30 days after the final dose of study treatment or until initiation of new systemic anti-cancer therapy, whichever occurred first, and SAEs and AESIs continued to be reported until 90 days after the final dose of study treatment or until initiation of new systemic anti-cancer therapy, whichever occurred first (Protocol v11, Section 5.4.2.2).

Treatment-emergent AEs were defined as AEs that occur after the first dose of study treatment. AEs were summarized by mapped Medical Dictionary for Regulatory Activities (MedDRA) v25.1 preferred terms (PTs) and appropriate MedDRA hierarchy. AE severity was graded according to National Cancer Institute Common Terminology Criteria for Adverse Events (NCI CTCAE) v4.0. Multiple occurrences of the same event were counted once at the maximum severity.

For classification purposes, lower level terms were assigned by the Sponsor to the original terms entered on the Case Report Form (CRF), using the most up-to-date version of the MedDRA v25.1 terminology for AEs and diseases and the World Health Organization Drug Global Dictionary (B3, 1 September 2022) for treatments. Glossaries of AEs (Cohort A: l_ae_gloss_A_SE; Cohort B: l_ae_gloss_B_SE; Cohort C: l_ae_gloss_C_SE), selected AEs (Cohort A: l_aesi_gloss_A_SE; Cohort B: l_aesi_gloss_B_SE; Cohort C: l_aesi_gloss_C_SE), medical history (Cohort A: l_mh_gloss_A_IT; Cohort B: l_mh_gloss_B_IT; Cohort C: l_mh_gloss_C_IT), concomitant medications (Cohort A: l_cm_gloss_A_IT; Cohort B: l_cm_gloss_B_IT; Cohort C: l_cm_gloss_C_IT), and death coded terms (Cohort A: l_dd_gloss_A_SE; Cohort B: l_dd_gloss_B_SE; Cohort C: l_dd_gloss_C_SE) are provided.

Patient narratives are provided for the following categories of events:

- Deaths Due to AEs
- Deaths Due to Disease Progression
- SAEs
- AE Leading to Study Treatment Discontinuation
- Pregnancy
- The following AEs (which includes ipatasertib AESIs [See Protocol v11, Section 5.2.3])
    - Grade ≥ 3 Hyperglycemia
    - Grade ≥ 3 Diarrhea
    - Grade ≥ 2 Colitis/ Enterocolitis
    - Grade ≥ 3 Rash
    - Grade ≥ 2 Pneumonitis
    - Grade ≥ 3 Hepatotoxicity
    - Cases of potential drug-induced liver injury that include an elevated alanine aminotransferase (ALT) or aspartate aminotransferase (AST) in combination with either an elevated bilirubin or clinical jaundice, as defined by Hy's Law
    - Suspected transmission of an infectious agent by the study drug
- COVID -19 SAEs

Laboratory data were classified according to NCI CTCAE and summarized descriptively over time, including change from baseline. The highest NCI CTCAE grades after baseline are also reported in addition to shift tables (from baseline to worst value after baseline). Normal ranges for laboratory values are provided.

Laboratory data are summarized descriptively over time, including change from baseline. Values outside the normal ranges and marked abnormalities are summarized separately. Handling of laboratory data and the Roche standard reference range, the marked reference range, and the criteria for potentially clinically relevant changes from baseline for each laboratory parameter are provided (Handling and Reporting of Laboratory Data).

3.7.5 Pharmacokinetic Data Analysis

Pharmacokinetic analyses for Cohort A and B are described in the primary CSRs (Cohort A Report No. 1101889; Cohort B Report No. 1100941). Ipatasertib and its M1 metabolite (G-037720) levels for Cohort C were measured on Day 1 of Cycle 1 (1–3 hours post-ipatasertib/placebo), Day 15 of Cycle 1 (predose and 1–3 hours post ipatasertib/placebo) and Day 15 of Cycle 3 (predose and 2–4 hours post ipatasertib/placebo). Atezolizumab levels were measured on Day 1 of Cycle 1 (prior to

start of infusion and 30 minutes after end of infusion), Day 15 of Cycle 1 (prior to start of infusion), and Day 1 of Cycle(s) 2, 3, 4, 8, 12 and 16 (prior to start of infusion). Pharmacokinetic concentrations of ipatasertib and atezolizumab were tabulated and summarized (mean, standard deviation, coefficient of variation, median, range, geometric mean, and geometric mean coefficient of variation) by cycle, as appropriate.

Bioanalytical reports (BAR; CO40016 PK Covance Final BAR and CO40016 PK ICON 188355 Final BAR) are provided.

3.7.6 Immunogenicity Analysis (Cohort C Only)

Serum samples were used to characterize the immunogenicity of atezolizumab. For the schedule of immunogenicity samples for Cohort C, refer to Protocol v11, Appendix 4.

Please refer to the bioanalytical report (CO40016 ADA ICON 188357 Final BAR) for the detailed methodology for the anti-drug antibody (ADA) analysis.

3.7.7 Changes in Planned Analyses

No changes to the planned analyses occurred since the SAP v2 was finalized. The statistical considerations and analysis plan are also provided in Protocol v11, Section 6 and are pertinent for all three cohorts. All details of statistical analyses for Study CO40016 Cohort A and B are described in the SAP v2 and supersede those specified in the study protocol where applicable.

4. STUDY POPULATION

4.1 DISPOSITION OF PATIENTS

At the time of the final efficacy cutoff date (30 October 2021), long-term follow-up was discontinued and patients in long-term follow-up were discontinued from the study. In addition, patients who were still on study treatment at this time were moved onto a post-trial access program where required. Discontinuations from the study due to this were captured as either “Other” or “Physician Decision”, and account for most of the discontinuations captured under these reasons.

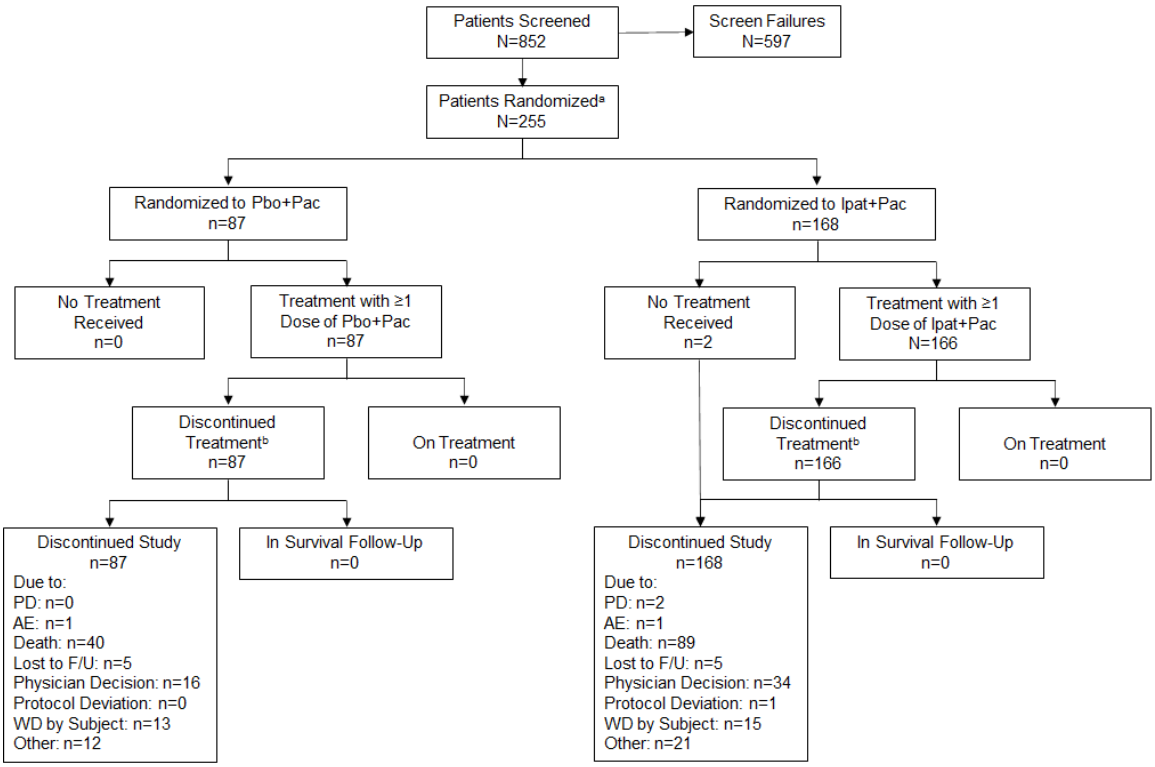
Cohort A

Data for screen failures and randomization assignments for Cohort A were reported in the primary CSR (Report No. 1101889).

Of the 255 randomized patients (ITT population), 253 patients received treatment; 166 (65.1%) and 87 (34.1%) in the Ipat+Pac arm and Pbo+Pac arm, respectively (Figure 2). At the time of CCOD, all patients had discontinued from study (t_ds_cut_A_IT).

The patient disposition for Cohort A is illustrated in Figure 2, and a list of investigators (List and Description of Investigators and Sites) for Cohort A is appended.

Figure 2 Patient Disposition (Cohort A, ITT Population)



AE = adverse event; F/U = follow-up; Ipat = ipatasertib; Pac = paclitaxel; Pbo = placebo; PD = progressive disease; WD = withdrawal.

[a] Patients were randomized 2:1 to the Ipat+Pac and Pac+Pbo arms.

[b] Discontinued treatment = Ipat/Pbo and Pac.

Cohort B

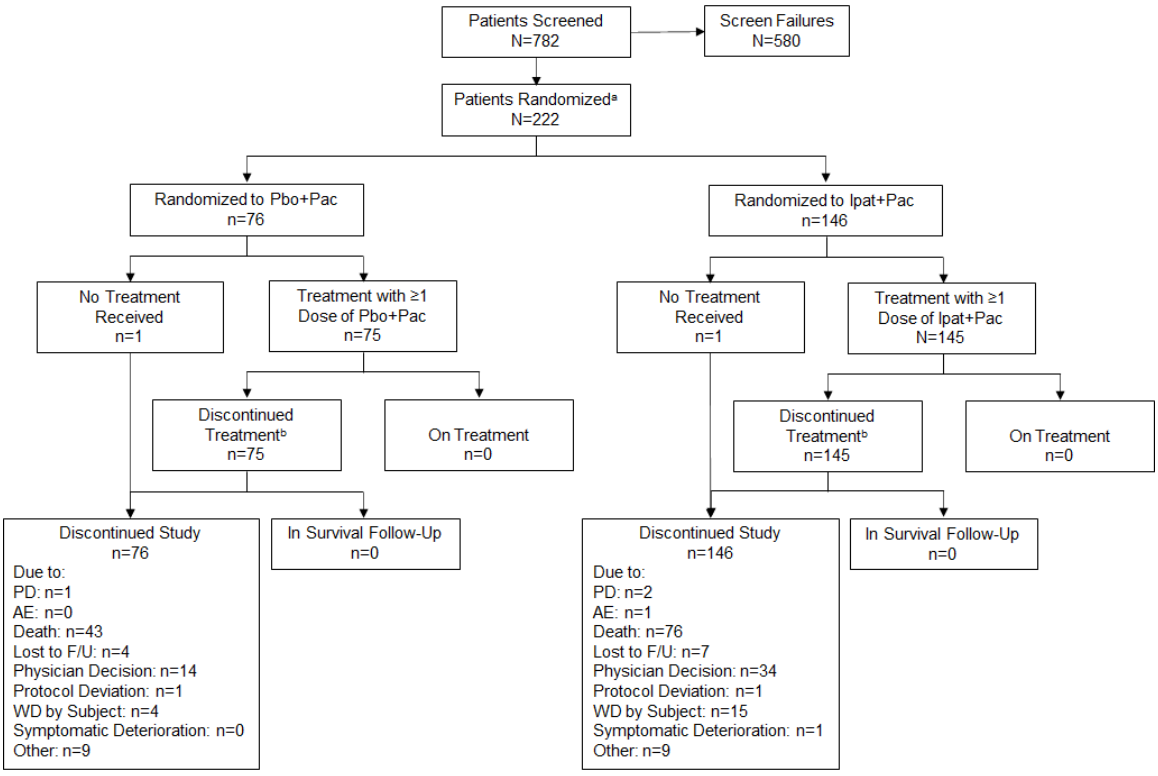
Data for screen failures and randomization assignments for Cohort B were reported in the primary CSR (Report No. 1100941).

A list of investigators (List and Description of Investigators and Sites) for Cohort B is appended.

Of the 222 randomized patients (ITT population), 220 patients overall received treatment; 145 (65.3%) and 75 (33.7%) in the Ipat+Pac arm and Pbo+Pac arm, respectively (Figure 3). At the time of CCOD, all patients had discontinued from study (t_ds_cut_B_IT).

The patient disposition for Cohort B is illustrated in Figure 3.

Figure 3 Patient Disposition (Cohort B, ITT Population)



AE = adverse event; F/U = follow-up; Ipat = ipatasertib; Pac = paclitaxel; Pbo = placebo; PD = progressive disease; WD = withdrawal.

[a] Patients were randomized 2:1 to the Ipat+Pac and Pac+Pbo arms.

[b] Discontinued treatment = Ipat/Pbo and Pac.

Cohort C

Patients who did not meet the biomarker eligibility for Cohort A were allowed to participate in Cohort C open-label treatment, provided they met all other eligibility criteria per protocol.

A total of 102 patients screened and all were enrolled. The first patient was enrolled on 25 March 2019 and the LPLV was on 4 January 2023.

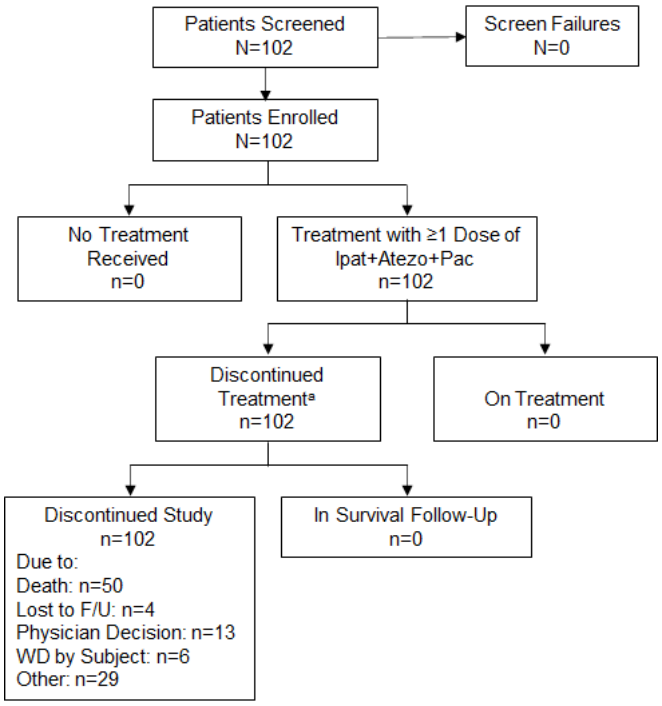
Study CO40016 (Cohort C) was conducted across 102 centers in the following 11 countries: Australia (3 centers), Republic of Korea (6), Singapore (1), Taiwan (3), France (6), United Kingdom (8), Poland (10), Ukraine (14), United States (13), Brazil (27), and Peru (11) (t_enroll_C_IT).

A list of investigators (List and Description of Investigators and Sites) for Cohort C is appended.

All 102 enrolled patients (ITT population) received treatment (Figure 4). At the time of CCOD, all patients had discontinued from study (t_ds_cut_C_IT).

The patient disposition for Cohort C is illustrated in Figure 4.

Figure 4 Patient Disposition (Cohort C, ITT Population)



Atezo = atezolizumab; F/U = follow-up; Ipat = ipatasertib; Pac = paclitaxel; WD = withdrawal.

[a] Discontinued treatment = Ipat, Atezo, and Pac.

4.2 PATIENTS WITHDRAWN PREMATURELY FROM TREATMENT OR STUDY

4.2.1 Discontinuation from Treatment

4.2.1.1 Discontinuation from Ipatasertib/Placebo

Cohort A

In the safety evaluable population, all patients in the Ipat+Pac arm and in the Pbo+Pac arm had discontinued ipatasertib/placebo. The most common reason for discontinuation in both treatment arms was progressive disease, which occurred in 65.7% and 72.4% of patients in the Ipat+Pac and Pbo+Pac arms, respectively. The second most common reason for discontinuation in the Ipat+Pac arm was AE (9.0%), and in the Pbo+Pac arm it was AE, withdrawal by subject, and “other” in the Pbo+Pac arm (each 6.9%) (Table 2).

Table 2 Discontinuation from Ipatasertib/Placebo (Cohort A, Safety Evaluable Population)

Patients Withdrawn from Ipatasertib/Placebo, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)	All Patients (N=253)
Reason for Treatment Discontinuation			
n	87	166	253
Adverse event	6 (6.9%)	15 (9.0%)	21 (8.3%)
Death	0	2 (1.2%)	2 (0.8%)
Lost to follow-up	0	1 (0.6%)	1 (0.4%)
Other	6 (6.9%)	7 (4.2%)	13 (5.1%)
Physician decision	3 (3.4%)	11 (6.6%)	14 (5.5%)
Progressive disease	63 (72.4%)	109 (65.7%)	172 (68.0%)
Symptomatic deterioration	3 (3.4%)	10 (6.0%)	13 (5.1%)
Withdrawal by subject	6 (6.9%)	11 (6.6%)	17 (6.7%)

Percentages are based on N in the column heading.

Cohort B

In the safety evaluable population, all patients in the Ipat+Pac arm and in the Pbo+Pac arm had discontinued ipatasertib/placebo. The most common reason for discontinuation in both treatment arms was progressive disease, which occurred in 67.6% and 72.0% of patients in the Ipat+Pac and Pbo+Pac arms, respectively. The second most common reason for discontinuation in the Ipat+Pac arm was AE (11.0%) and in the Pbo+Pac arm, it was physician decision and “other” (each 8.0%) (Table 3).

Table 3 Discontinuation from Ipatasertib/Placebo (Cohort B, Safety Evaluable Population)

Patients Withdrawn from Ipatasertib/Placebo, Cohort B: HR+/HER2- Patients, Safety Evaluable Population
Protocol: CO40016

Cohort C

In the safety evaluable population, all patients had discontinued ipatasertib. The most common reason for discontinuation was progressive disease, which occurred in 61.8% of patients, followed by “other” (11.8%) and AE (10.8%) (Table 4).

4.2.1.2 Discontinuation from Paclitaxel

Cohort A

In the safety evaluable population, 99.4% of patients in the Ipat+Pac arm and all patients in the Pbo+Pac arm had discontinued paclitaxel. Of note, all patients in the Ipat+Pac arm had discontinued paclitaxel, however, a study drug discontinuation eCRF for paclitaxel was inadvertently not completed for 1 patient. The most common reason for discontinuation in both treatment arms was progressive disease, which occurred in 61.4% and 69.0% of patients in the Ipat+Pac and Pbo+Pac arms, respectively. The second most common reason for discontinuing paclitaxel was AE in both arms (14.5% in the Ipat+Pac arm and 16.1% in the Pbo+Pac arm) (Table 5).

Table 5 Discontinuation from Paclitaxel (Cohort A, Safety Evaluable Population)

Cohort B

In the safety evaluable population, all patients in the Ipat+Pac arm and in the Pbo+Pac arm had discontinued paclitaxel. The most common reason for discontinuation in both treatment arms was progressive disease, which occurred in 51.7% and 62.7% of patients in the Ipat+Pac and Pbo+Pac arms, respectively. The second most common reason for discontinuing paclitaxel was AE in both arms (28.3% in the Ipat+Pac arm and 16.0% in the Pbo+Pac arm) (Table 6).

Cohort C

In the safety evaluable population, all patients had discontinued paclitaxel. The most common reason for discontinuation was progressive disease, which occurred in 54.9% of patients. The second most common reason for discontinuing paclitaxel was AE (21.6%) (Table 7).

4.2.1.3 Discontinuation from Atezolizumab (Cohort C Only)

In the safety evaluable population, all patients had discontinued atezolizumab. The most common reason for discontinuation was progressive disease, which occurred in 61.8% of patients. The second most common reason for discontinuing atezolizumab was AE (12.7%) (Table 8).

4.2.2 Discontinuation from Study

Cohort A

Overall, in the ITT population, all patients in the Ipat+Pac arm and in the Pbo+Pac arm had discontinued from the study (Table 9). The most common reason for study discontinuation was death, which occurred in 53.0% and 46.0% of patients in the Ipat+Pac arm and the Pbo+Pac arm, respectively. The second most common reason for study discontinuation was physician decision in both arms (20.2% in the Ipat+Pac arm and 18.4% in the Pbo+Pac arm [see Disposition of Patients]).

A listing of patients who had discontinued from study (l_ds_A_IT) by discontinuation reason is provided.

Cohort B

Overall, in the ITT population, all patients in the Ipat+Pac arm and in the Pbo+Pac arm had discontinued from the study (Table 10). The most common reason for study discontinuation was death, which occurred in 52.1% and 56.6% of patients in the Ipat+Pac arm and the Pbo+Pac arm, respectively. The second most common reason for study discontinuation was physician decision in both arms (23.3% in the Ipat+Pac arm and 18.4% in the Pbo+Pac arm [see Disposition of Patients]).

A listing of patients who had discontinued from study (l_ds_B_IT) by discontinuation reason is provided.

Cohort C

Overall, in the ITT population, all patients had discontinued from the study (Table 11). The most common reason for study discontinuation was death, which occurred in 49.0% of patients. The second most common reason for study discontinuation was “other” (28.4% [see Disposition of Patients]).

A listing of patients who had discontinued from study (l_ds_C_IT) by discontinuation reason is provided.

4.3 PROTOCOL DEVIATIONS AND QUALITY TOLERANCE LIMITS

4.3.1 Protocol Deviations

Major protocol deviations were defined as those that had the potential to significantly impact patient safety, the efficacy of the treatment regimen, or the study analysis (i.e., the validity/reliability of the data).

The major protocol deviations were grouped into four categories: procedural, medication, inclusion criteria, and exclusion criteria. All patients with protocol deviations were included in the efficacy analyses presented in this CSR.

Cohort A

As of the CCOD, 32.2% of the ITT population had at least one major protocol deviation (Table 12). The proportion of patients with protocol deviations was slightly higher in the Ipat+Pac arm (33.9%) as compared with the Pbo+Pac arm (28.7%). There were no notable differences between the two treatment arms with respect to the type of major deviations. The most frequent protocol deviations were procedural (20.0%), followed by inclusion criteria (10.2%), medications (5.9%), and exclusion criteria (3.5%).

A listing of patients with major protocol deviations is appended (l_dv_A_IT).

Table 12 Major Protocol Deviations (Cohort A, ITT Population)

Major Protocol Deviations, Cohort A: TNBC, Intent-to-Treat Population
Protocol: CO40016

Category Description	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=168)	All Patients (N=255)
Total number of patients with at least one major protocol deviation	25 (28.7%)	57 (33.9%)	82 (32.2%)
Total number of major protocol deviations	28	73	101
EXCLUSION CRITERIA			
Total	4 (4.6%)	5 (3.0%)	9 (3.5%)
Chemo <12 months prior to recurrence/chemo in ABC	2 (2.3%)	3 (1.8%)	5 (2.0%)
Medical hx/current diagnosis of excluded condition	1 (1.1%)	0	1 (0.4%)
Prior systemic therapy (chemo, checkpoint inhibitors, targeted agent) for LA or metastatic TNBC	0	1 (0.6%)	1 (0.4%)
Uncontrolled Type1 or TypeII Diabetes requiring insulin	1 (1.1%)	1 (0.6%)	2 (0.8%)
INCLUSION CRITERIA			
Total	5 (5.7%)	21 (12.5%)	26 (10.2%)
Adequate hematologic/organ function within 14days prior to first study treatment	3 (3.4%)	9 (5.4%)	12 (4.7%)
Key screening assessments outside relevant window	2 (2.3%)	7 (4.2%)	9 (3.5%)
Measurable disease per RESIST v1.1	0	1 (0.6%)	1 (0.4%)
Signed Informed Consent	0	4 (2.4%)	4 (1.6%)
MEDICATION			
Total	2 (2.3%)	13 (7.7%)	15 (5.9%)
Dosage - study drugs not adjusted despite toxicity	0	2 (1.2%)	2 (0.8%)
Dosage - underdosage, ipatasertib/placebo	0	2 (1.2%)	2 (0.8%)
Dosage - underdosage, paclitaxel	0	1 (0.6%)	1 (0.4%)
Patient received incorrect treatment/ damaged drug	0	3 (1.8%)	3 (1.2%)
Prohibited concomitant medication or food	2 (2.3%)	1 (0.6%)	3 (1.2%)
Study treatment not discontinued per guidelines	0	4 (2.4%)	4 (1.6%)
PROCEDURAL			
Total	17 (19.5%)	34 (20.2%)	51 (20.0%)
Delay of 2 or more cycles to complete an updated ICF	1 (1.1%)	3 (1.8%)	4 (1.6%)
Dose not modified following specific toxicity	0	1 (0.6%)	1 (0.4%)
Failure to report a SAE per protocol	1 (1.1%)	0	1 (0.4%)
Improper Stratification Criteria Selection	3 (3.4%)	8 (4.8%)	11 (4.3%)
Incorrect Cohort Assignment or Incorrect Randomization	1 (1.1%)	2 (1.2%)	3 (1.2%)
Missed 2 or more efficacy assessments	0	3 (1.8%)	3 (1.2%)
Non-compliance with impact to patient safety or study integrity	10 (11.5%)	17 (10.1%)	27 (10.6%)
Unblinding without appropriate reason	1 (1.1%)	0	1 (0.4%)

Cohort B

As of the CCOD, 46.8% of the ITT population had at least one major protocol deviation (Table 13). The proportion of patients with protocol deviations was similar between treatment arms (Ipat+Pac: 45.2% vs. Pbo+Pac: 50.0%). There were no notable differences between the two treatment arms with respect to the type of major deviations. The most frequent protocol deviations were procedural (41.4%), followed by inclusion criteria (10.4%), exclusion criteria (9.0%), and medication (8.1%).

A listing of patients with major protocol deviations is appended (l_dv_B_IT).

4.3.2 Quality Tolerance Limits

A risk-based quality management approach was used in this study to manage quality throughout all stages and focused on essential activities to ensure human subject protection and the reliability of study results. The QTL plan documents risks and controls that were retrospectively applied to Cohort A of the study after first patient in. QTLs were implemented as per the QTL plan for Cohort A only. Descriptions of important deviations from the defined QTLs and remedial actions taken are provided in Quality Tolerance Limit Deviations and Remedial Actions.

4.4 POPULATIONS ANALYZED

The overviews of analysis populations for Cohorts A and B were presented in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941).

An overview of the analysis populations for Cohort C is presented below. Analysis populations are defined in Analysis Populations.

For Cohort C, the number of patients included in each analysis population is shown in Table 15. One patient was excluded from the PRO evaluable population, due to missing baseline assessments.

A listing of patients excluded from analysis populations is appended (l_pop_C_IT).

Table 15 Overview of Analysis Populations (Cohort C, ITT Population)

4.5 DEMOGRAPHIC AND OTHER BASELINE CHARACTERISTICS

4.5.1 Demographics and Baseline Characteristics

Demographics and baseline characteristics for Cohorts A and B were presented in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). Demographics and baseline characteristics for Cohort C are presented below.

Cohort C

In the ITT population, all patients were women, and the majority were White (53.9%), followed by Unknown (14.7%), or Asian (11.8%). The median age was 55 years (range: 22–83 years). In accordance with the protocol inclusion criteria, all patients had a high baseline functional status (i.e., Eastern Cooperative Oncology Group Performance Status [ECOG PS] 0: 59.8% or 1: 40.2%). The majority of patients (74.5%) had metastatic disease at baseline. Prior breast cancer radiotherapy, prior anthracycline therapy, or prior taxane therapy were reported in 35.3%, 35.3%, and 37.3% of patients, respectively (Table 16).

The proportion of patients with a disease-free interval and chemotherapy-free interval of >3 years were 5.9% and 3.9%, respectively.

Table 16 Demographics and Baseline Characteristics (Cohort C, ITT Population)

PD-L1 status	
n	102
PD-L1 Positive	40 (39.2%)
PD-L1 Negative	25 (24.5%)
PD-L1 Unknown	37 (36.3%)

The percentages are based on n. Disease Free Interval is defined as time from the final curative-intent breast surgery to the initial diagnosis of LABC/MBC. Chemotherapy Free Interval is defined as time from the last date of neoadjuvant/adjuvant chemotherapy administered to the start date of study treatment. DFI and CFI are "Not Available" for subjects having a Partial Date or Missing Date. Visceral disease is displayed as Yes or No for patients with metastatic disease, and displayed as Not Applicable for patients without metastatic disease. All recorded sites of disease except for the following are counted as visceral sites: bone, bone marrow, breast, chest, head, lymph node, neck, skin, soft tissue. Number of sites of disease in patients with mBC is displayed as Not Applicable for patients without metastatic disease. *BRCA1/2 mutation is by molecular testing and cannot distinguish between germline and somatic.

4.5.2 Baseline Disease Characteristics

Baseline disease characteristics for Cohorts A and B were presented in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). Baseline disease characteristics for Cohort C is presented below.

Overall, in the Cohort C ITT population, the most common diagnosed histopathological subtype was ductal (73.3%). Most patients were initially diagnosed with poorly differentiated Grade 3 breast cancer (60.8%). The most common stage at initial diagnosis was Stage IV (36.3%) followed by Stage III (30.4%) and Stage II (22.5%) (t_mh_bchist_C_IT).

4.5.3 Prior and Concurrent Diseases

Prior diseases (defined as diseases resolved at baseline) and concurrent diseases (defined as ongoing diseases at baseline) for Cohorts A and B were presented in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). Concurrent diseases for Cohort C are presented below.

In the ITT population, 75.5% of patients had at least one active medical condition at baseline (t_mh_CNCR_C_IT). The most common concurrent disease by System Organ Class (SOC; ≥30% of patients) was Vascular disorders (32.4%).

4.6 PRIOR AND CONCOMITANT THERAPY

Prior medications for Cohorts A and B were presented in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941). Concomitant medications for all cohorts are presented below.

Concomitant medications were coded using WHODRUG GLOBAL dictionary (B3, 1 September 2022), using this coding system, a single concomitant medication may code to more than one class (e.g., use of corticosteroids as premedication for paclitaxel is counted towards the following categories: corticosteroids for systemic use, ophthalmological, nasal preparations, stomatological preparations, etc.).

In accordance with the protocol (Protocol v11, Section 4.3.3), if allowed locally, prophylactic loperamide for diarrhea management was mandated in the first cycle, dose adjusted as necessary, and continued as per investigator judgment.

Cohort A

Almost all patients received at least one concomitant medication that temporally overlapped with study drug administration (Ipat+Pac 98.8% vs. Pbo+Pac 100%) (t_cm_CNCM_NFC_A_IT). The most commonly used concomitant medications were as expected for this patient population and generally similar between the treatment arms. The most commonly used classes of drugs (≥ 80%) were premedications administered for paclitaxel (i.e., steroids, antihistamines and histamine H_2-receptor antagonists).

Cohort B

Almost all patients received at least one concomitant medication that temporally overlapped with study drug administration (Ipat+Pac 98.6% vs. Pbo+Pac 98.7%) (t_cm_CNCM_NFC_B_IT). The most commonly used concomitant medications were as expected for this patient population and generally similar between the treatment arms. The most commonly used classes of drugs (≥80%) were premedications administered for paclitaxel (i.e., steroids, antihistamines and histamine H_2-receptor antagonists).

Cohort C

All patients received at least one concomitant medication that temporally overlapped with study drug administration (t_cm_CNCM_NFC_C_IT). The most commonly used concomitant medications were as expected for this patient population. The most commonly used classes of drugs (≥ 80%) were premedications administered for paclitaxel and atezolizumab (i.e., steroids, antihistamines, histamine H_2-receptor antagonists, anti-emetics and anti-nauseants).

4.7 EXPOSURE

4.7.1 Exposure to Study Treatment

4.7.1.1 Ipatasertib/Placebo

Cohort A

At the time of the CCOD, the median duration of ipatasertib/placebo treatment was 5.3 months (range: 0–46) in the Ipat+Pac arm and 5.7 months (range: 0–44) in the Pbo+Pac arm (Table 17). Patients in the Ipat+Pac arm received a median number of 115.5 doses with a mean dose intensity (with respect to total number of doses) of 96.3%. The mean dose intensity (with respect to total dose) was 90.7% in the Ipat+Pac arm. Patients in the Pbo+Pac arm received a median number of 126 doses with a mean dose intensity (with respect to total number of doses) of 97.9%.

A higher proportion of patients had dose modifications in the Ipat+Pac arm (33.7%) compared with the Pbo+Pac arm (16.1%). The most common reason for ipatasertib/placebo dose modification in both treatment arms was AEs (Ipat+Pac: 91.1% vs. Pbo+Pac: 57.1%).

A summary of treatment discontinuation of ipatasertib/placebo in the safety evaluable population is appended (t_ds_ipat_A_SE).

Cohort B

At the time of the CCOD, the median duration of ipatasertib/placebo treatment was 8 months (range: 0–48) in the Ipat+Pac arm and 9.1 months (range: 0–48) in the Pbo+Pac arm (Table 18). Patients in the Ipat+Pac arm received a median number of 188 doses with a mean dose intensity (with respect to total number of doses) of 95.58%. The mean dose intensity (with respect to total dose) was 87.87% in the Ipat+Pac arm. Patients in the Pbo+Pac arm received a median number of 210 doses with a mean dose intensity (with respect to total number of doses) of 98.97%.

A higher proportion of patients had dose modifications in the Ipat+Pac arm (36.6%) compared with the Pbo+Pac arm (13.3%). The most common reason for ipatasertib/placebo dose modification in both treatment arms was AEs (Ipat+Pac: 94.3% vs. Pbo+Pac: 60.0%).

A summary of treatment discontinuation of ipatasertib/placebo in the safety evaluable population is appended (t_ds_ipat_B_SE).

Cohort C

At the time of the CCOD, the median duration of ipatasertib treatment was 6.2 months (range: 0–43) (Table 19). Patients received a median number of 138.5 doses with a mean dose intensity (with respect to total number of doses) of 93.99%. The mean dose intensity (with respect to total dose) was 87.08%.

The proportion of patients with ipatasertib dose modifications was 41.2%. The most common reason for ipatasertib dose modification was AEs (90.5%).

A summary of treatment discontinuation of ipatasertib in the safety evaluable population is appended (t_ds_ipat_C_SE).

4.7.1.2 Paclitaxel

Cohort A

At the time of the CCOD, the median duration of paclitaxel treatment in the Ipat+Pac arm was 5.1 months (range: 0– 38) and 5.3 months (range: 0– 39) in the Pbo+Pac arm (Table 20). Patients in the Ipat+Pac arm received a median number of 16 doses with a mean dose intensity (with respect to total number of doses) of 97.45%. Patients in the Pbo+Pac arm received a median number of 18 doses with a mean dose intensity (with respect to total number of doses) of 97.45%. The mean dose intensity (with respect to total dose) was 95.29% in the Ipat+Pac arm and 96.16% in the Pbo+Pac arm.

The proportion of patients with dose modifications was higher in the Ipat+Pac arm (24.1%) and the Pbo+Pac arm (18.4%). The most common reason for paclitaxel dose modification in both treatment arms was AEs (Ipat+Pac: 95.0% vs. Pbo+Pac: 87.5%).

A summary of treatment discontinuation of paclitaxel in the safety evaluable population is appended (t_ds_pac_A_SE).

Cohort B

At the time of the CCOD, the median duration of paclitaxel treatment in the Ipat+Pac arm was 6.9 months (range: 0– 48) and 8.8 months (range: 0– 47) in the Pbo+Pac arm

(Table 21). Patients in the Ipat+Pac arm received a median number of 23.5 doses with a mean dose intensity (with respect to total number of doses) of 97.37%. Patients in the Pbo+Pac arm received a median number of 29 doses with a mean dose intensity (with respect to total number of doses) of 97.64%. The mean dose intensity (with respect to total dose) was 94.39% in the Ipat+Pac arm and 94.53% in the Pbo+Pac arm.

The proportion of patients with dose modifications was similar between the Ipat+Pac arm (34%) and the Pbo+Pac arm (32%). The most common reason for paclitaxel dose modification in both treatment arms was AEs (Ipat+Pac: 93.9% vs. Pbo+Pac: 79.2%).

A summary of treatment discontinuation of paclitaxel in the safety evaluable population is appended (t_ds_pac_B_SE).

4.8 EFFICACY OBSERVATION TIME

The overall median duration of survival follow-up for Cohorts A, B, and C were 17.9 months (min. 0 months; max. 43.5 months) (t_ef_fudur_A_IT_30OCT2021_40016), 22.42 months (min. 0 months; max. 44.6 months) (t_ef_fudur_B_IT_30OCT2021_40016), and 18.02 months (min. 1.8 months; max. 28.4 months) (t_ef_fudur_C_IT_30OCT2021_40016), respectively.

5. EVALUATION OF RESPONSE TO STUDY TREATMENT

5.1 EFFICACY

The efficacy results presented throughout Section 5.1 of the final CSR for Study CO40016 are based on a CCOD of 30 October 2021.

5.1.1 Efficacy Summary

As described in the primary CSRs for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), these did not meet its primary efficacy endpoint, with no clinically meaningful benefit observed for ipatasertib in combination with paclitaxel over paclitaxel alone. For both Cohorts A and B, data for the interim analysis of the key secondary endpoint of OS was immature at the CCOD for primary analysis. Results of other secondary endpoints were consistent with those of the primary endpoint, PFS.

This CSR describes the final efficacy data for all cohorts, specifically, final OS for Cohort A and Cohort B (Table 24), and PFS, OS, and other secondary efficacy endpoints for Cohort C (Table 25). While efficacy results for Cohort C were descriptive in nature, the median duration of PFS and OS were consistent with the Ipat+Pac arm in Cohort A.

Table 24 Final Overall Survival for Cohort A and Cohort B (CCOD: 30 October 2021)

Key Secondary Efficacy Endpoint				
Overall Survival (Final Analysis)				
	Cohort A		**Cohort B**	
	Pbo + Pac	**Ipat + Pac**	**Pbo + Pac**	**Ipat + Pac**
ITT Population	**n=87**	**n=168**	**n=76**	**n=146**
Patients with event (%)	39 (44.8%)	87 (51.8%)	43 (56.6%)	77 (52.7%)
Median duration of survival – months (95% CI)	24.9 (16.9, 40.4)	24.2 (19.2, 29.4)	28.4 (20.6, 37.3)	29.0 (22.4, 34.8)
Stratified Hazard Ratio (95% CI)	1.08 (0.73, 1.58)		0.94 (0.65, 1.37)	
Unstratified Hazard Ratio (95% CI)	1.05 (0.72, 1.54)		0.92 (0.64, 1.34)	

CCOD = clinical cutoff date; Ipat = ipatasertib; ITT = intent-to-treat; n = number of patients; Pac = paclitaxel; Pbo = placebo.

5.1.2 Primary Efficacy Endpoint: Progression-Free Survival (Investigator)

The primary efficacy endpoint results for Cohort A and B were reported in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), respectively.

For Cohort C, at the time of CCOD, 78 (76.5%) patients had progressed or died in the ITT population. The one-year event-free rate was 31.17% (95% CI: 21.59, 40.76). The KM-estimated median duration of PFS was 7.1 months (95% CI: 5.5, 9.1) (Table 25, Table 26, g_ef_km_PFSINV_C_IT_30OCT2021_40016).

Table 26 Time to Event Summary for Investigator-Assessed Progression-Free Survival (ITT Population)

5.1.3 Key Secondary Efficacy Endpoints

5.1.3.1 Overall Survival

As the primary endpoint of PFS was not met, the OS analysis results for all cohorts were considered descriptive.

Cohort A

At the time of CCOD, deaths had occurred in 51.8% and 44.8% of patients in the Ipat+Pac arm and Pbo+Pac arm, respectively, and the stratified HR was 1.08 (95% CI: 0.73, 1.58) (Table 27). The KM-estimated median OS was 24.2 months in the Ipat+Pac arm (95% CI: 19.2, 29.4) and 24.9 months in the Pbo+Pac arm (95% CI: 16.9, 40.4), with no clinically meaningful separation between the OS curves of the two treatment arms (Figure 5).

Table 27 Time to Event Summary for Overall Survival, Cohort A (ITT Population)

Time to Event Summary for Overall Survival, Cohort A: TNBC, Intent-to-Treat Population
Protocol: CO40016

Overall Survival

	Placebo + Paclitaxel (N=87)		Ipatasertib + Paclitaxel (N=168)

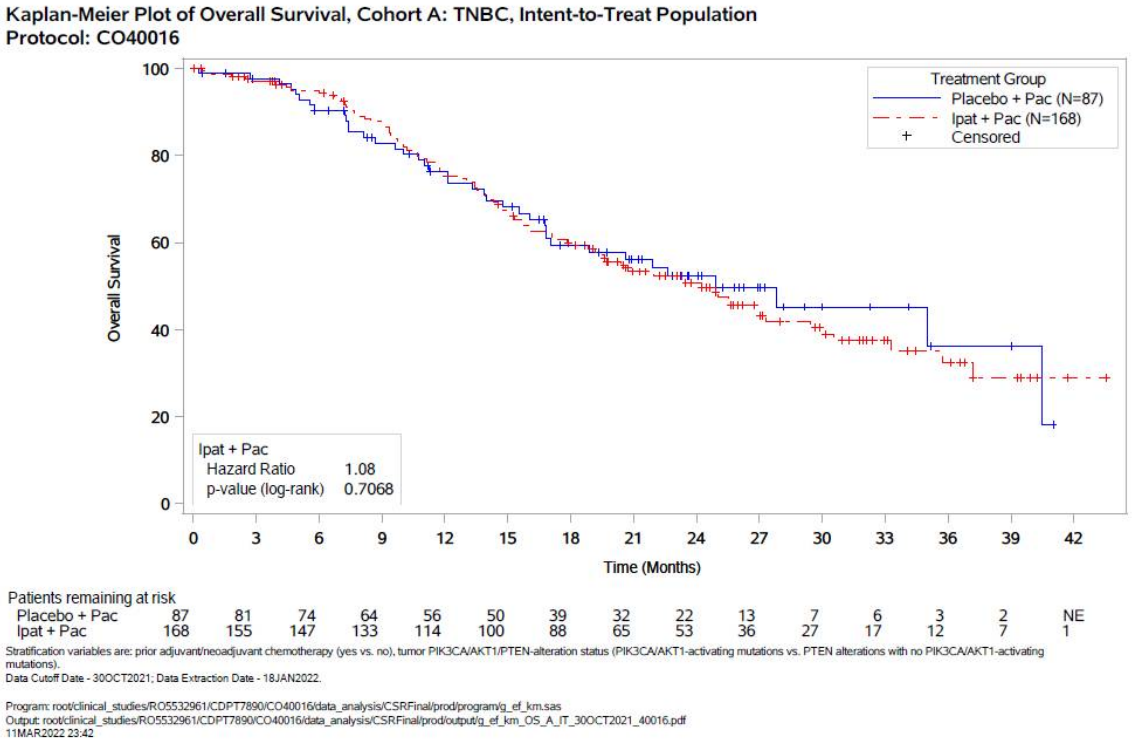
Figure 5 Kaplan-Meier Plot of Overall Survival, Cohort A (ITT Population)



Cohort B

At the time of CCOD, a similar proportion of deaths had occurred in the Ipat+Pac arm (52.7%%) and the Pbo+Pac arm (56.6%) and the stratified HR was 0.94 (95% CI: 0.65, 1.37) (Table 28). The KM-estimated median OS was 29.0 months in the Ipat+Pac arm (95% CI: 22.4, 34.8) and 28.4 months in the Pbo+Pac arm (95% CI: 20.6, 37.3), with no clinically meaningful separation between the OS curves of the two treatment arms (Figure 6).

5.1.4 Other Secondary Efficacy Endpoints (Cohort C Only)

The results for other secondary efficacy endpoints (investigator-assessed ORR, DOR, and CBR) for Cohorts A and B were reported in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), respectively. The results for these secondary efficacy endpoints for Cohort C are presented below.

5.1.4.1 Objective Response Rate (Investigator)

Among patients with measurable disease, 52.9% were responders, with 7 patients having a CR and 47 patients having a PR (Table 25, t_ef_bor_BORINV_C_MDBI_IT_30OCT2021_40016).

5.1.4.2 Duration of Objective Response (Investigator)

Among responders, 40.7% of patients (n=22) had ongoing response by the CCOD. The KM-estimated median DOR was 8.7 months (95% CI: 5.7, 12.,7) (Table 25, t_ef_dor_DORINV_C_MDBI_IT_30OCT2021_40016).

5.1.4.3 Clinical Benefit Rate (Investigator)

The investigator-assessed CBR was 54.9% (95% CI: 44.74, 64.78) (Table 25, t_ef_ccb_CCBINV_C_MDBI_IT_30OCT2021_40016).

5.1.4.4 Patient-Reported Outcomes

The results for PROs for Cohorts A and B were reported in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), respectively. The results for PROs for Cohort C are presented below and are based on a snapshot of 21 March 2023.

5.1.4.4.1 Questionnaire Completion Rates: EORTC QLQ-C30

The completion rate of the EORTC QLQ-C30 at baseline (Cycle 1, Day 1) was high at 100% (at least one question completed). Completion rates remained ≥85.7% for all cycles, except for Cycle 31 (75%). Completion rates during long-term follow-up visits ranged from a high of 67.4% at 12 months to a low of 25% (n=2/8) at 21 months. PRO completion rates and reasons for missing data for the EORTC QLQ-C30 by timepoint are appended (t_qs_comp_C30INST_C_IT).

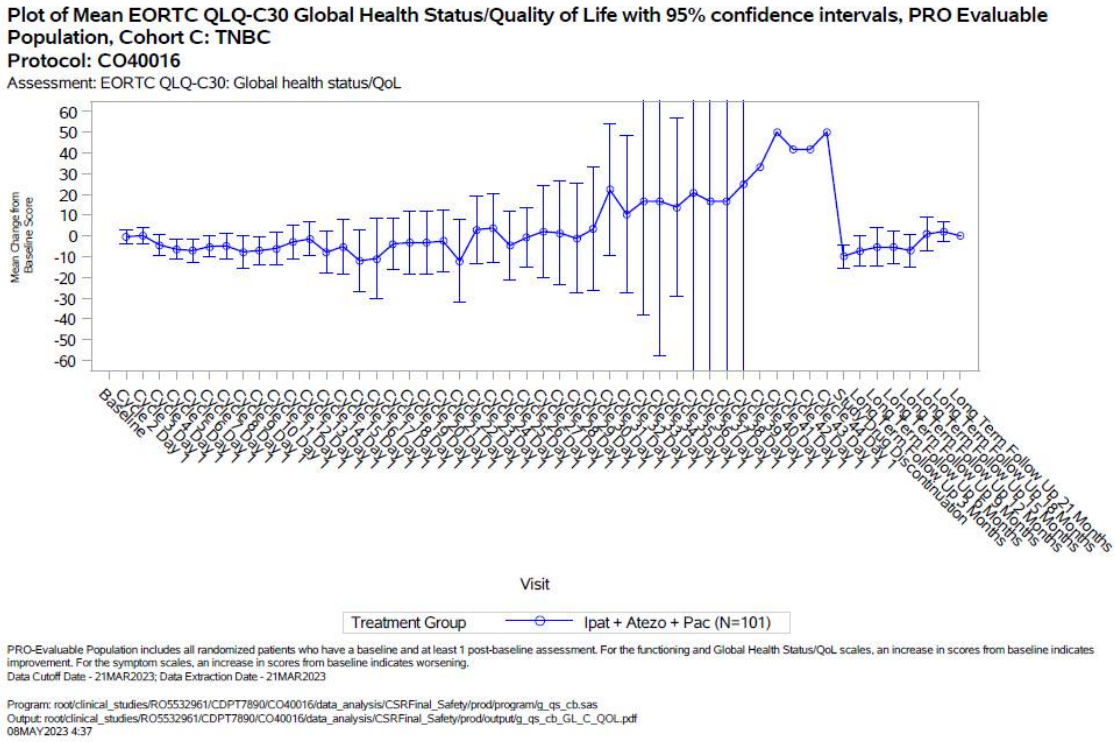
5.1.4.4.2 Secondary PRO Endpoint: GHS/QoL – EORTC QLQ-C30

Beyond Cycle 7, less than half of the PRO evaluable population were still on treatment (t_qs_cb_GL_C_QOL), precluding a meaningful analysis following the Cycle 7 assessment. Thus, interpretation will focus on patient-reported data through Cycle 7.

The mean GHS/QoL score at baseline was 74.92 (t_qs_cb_GL_C_QOL).

The mean change from baseline scores in GHS/QoL remained stable (i.e., within 8 points of the baseline score) through Cycle 7, with no clinically meaningful deterioration (i.e., a ≥10-point decrease from baseline in mean change score; Osoba et al. 1998) observed (Figure 7), indicating patients' baseline GHS/QoL was maintained during this time period.

Figure 7 Plot of Mean EORTC QLQ-C30 Global Health Status/Quality of Life Change from Baseline with 95% Confidence Intervals (PRO Evaluable Population)



EOTRC QLQ-C30 = European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire Core 30; PRO = patient-reported outcome.

5.2 SAFETY

Results presented in this section are based on a snapshot of 21 March 2023.

Throughout this section, where treatment arms are not specifically stated for Cohorts A and B, the presentation of results is as follows: results in the Ipat + Pac arm are provided first followed by the Pbo + Pac arm.

5.2.1 Safety Summary

Ipatasertib in combination with paclitaxel (Cohorts A and B) or with atezolizumab and paclitaxel (Cohort C) was well tolerated, and the safety profile of the combination treatment regimen was consistent with the known risks of each individual study treatment component. No new safety concerns were identified. Overviews of the key safety results for Cohort A (Table 30), Cohort B (Table 31), and Cohort C (Table 32) are provided.

Cohort A

The key safety findings for Cohort A were:

- The median duration of ipatasertib/placebo treatment was 5.3 months in the Ipat+Pac arm and 5.7 months in the Pbo+Pac arm. The median duration of paclitaxel treatment was 5.1 months in the Ipat + Pac arm and 5.3 months in the Pbo + Pac arm.
- The most frequent AEs (by PT) of any grade (reported in ≥30% of patients) were diarrhea, alopecia, nausea, and vomiting in the Ipat + Pac arm and diarrhea, alopecia and constipation in the Pbo+Pac arm.
- Grade≥3 AEs were reported in a similar proportion of patients in the Ipat+Pac arm and the Pbo+Pac arm (50.6% vs. 46.0%). The most frequent Grade ≥3 AEs (by PT) with ≥5% incidence were diarrhea and neutropenia in the Ipat+Pac arm, and neutrophil count decreased in the Pbo+Pac arm.
- A total of 132 deaths were reported in the safety evaluable population (Ipat+Pac: 91 patients [54.8%] vs. Pbo+Pac: 41 patients [47.1%]). The primary cause of death was progressive disease.
- Grade 5 AEs were reported in 2 patients in both Ipat+Pac (1.2%) and Pbo+Pac (2.3%) arms. Of these, 1 AE (by PT) of tumor lysis syndrome in the Pbo+Pac arm was considered related to both placebo and paclitaxel by the investigator.
- SAEs were reported in a similar proportion of patients in the Ipat+Pac arm and the Pbo+Pac arm (20.5% vs. 23.0%). SAEs (by PT) reported in ≥1% of patients (i.e., ≥2 patients) in the Ipat+Pac arm were: diarrhea, febrile neutropenia, pulmonary embolism, pneumonia, nausea, and vomiting. SAEs (by PT) reported in more than 1 patient in the Pbo+Pac arm were: pneumonia and pleural effusion.
- The proportion of patients who experienced AEs leading to ipatasertib/placebo treatment discontinuation was higher in the Ipat+Pac arm compared with Pbo+Pac arm (10.2% vs. 6.9%)
- AEs leading to discontinuation of paclitaxel was reported in 15.1% of patients in the Ipat+Pac arm and 16.1% of patients in the Pbo + Pac arm.
- Selected AEs were reported in both treatment arms (Ipat+Pac: 94.6% vs. Pbo+Pac: 90.8%). Selected AEs of diarrhea, asthenia, nausea, rash, vomiting, hyperglycemia and oral mucositis were observed with a higher frequency (≥5% difference) in the Ipat+Pac arm compared with the Pbo+Pac arm. Peripheral neuropathy, neutropenia, erythropenia, hepatotoxicity, hyperlipidemia, pneumonia, thrombocytopenia, pneumonitis, colitis, and erythema multiforme were reported with < 5% difference between treatment arms. Of the safety evaluable patients, for selected AEs, 51.8% experienced a highest Grade of 1–2 in the Ipat + Pac arm, 57.5% experienced a highest Grade of 1–2 in the Pbo + Pac arm, 42.8% experienced a highest Grade of 3–4 in the Ipat + Pac arm, and 33.3% experienced a highest Grade of 3–4 in the Pbo + Pac arm.

Table 30 Safety Summary, Cohort A: TNBC Patients (Safety Evaluable Population)

Safety Summary, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)
Total number of patients with at least one AE	84 (96.6%)	162 (97.6%)
Total number of AEs	976	2645
Total number of patients with at least one		
AE with fatal outcome	2 (2.3%)	2 (1.2%)
Serious AE	20 (23.0%)	34 (20.5%)
AE leading to discontinuation from Ipatasertib/placebo	6 (6.9%)	17 (10.2%)
AE leading to discontinuation from Paclitaxel	14 (16.1%)	25 (15.1%)
AE leading to discontinuation from any treatment	14 (16.1%)	31 (18.7%)
AE leading to Ipatasertib/placebo dose reduction	7 (8.0%)	46 (27.7%)
AE leading to Paclitaxel dose reduction	9 (10.3%)	34 (20.5%)
AE leading to dose reduction from any treatment	12 (13.8%)	64 (38.6%)
AE leading to Ipatasertib/placebo dose interruption	26 (29.9%)	74 (44.6%)
AE leading to Paclitaxel dose interruption	41 (47.1%)	85 (51.2%)
AE leading to dose interruption from any treatment	43 (49.4%)	98 (59.0%)
Grade >=3 AE	40 (46.0%)	84 (50.6%)
AE related to Ipatasertib/placebo	55 (63.2%)	152 (91.6%)
AE related to Paclitaxel	81 (93.1%)	152 (91.6%)
AE related to any treatment	83 (95.4%)	156 (94.0%)

Investigator text for AEs is coded using MedDRA version 25.1. Percentages are based on N in the column headings. Multiple occurrences of the same AE in one individual are counted only once except for 'Total number of AEs' row in which multiple occurrences of the same AE are counted separately.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Cohort B

The key safety findings for Cohort B were:

- The median duration of ipatasertib/placebo treatment was 8 months in the Ipat+Pac arm and 9.1 months in the Pbo+Pac arm. The median duration of paclitaxel treatment was 6.9 months in the Ipat + Pac arm and 8.8 months in the Pbo + Pac arm.
- The most frequent AEs (by PT) of any grade (reported in ≥30% of patients) were: diarrhea, alopecia, anemia, neuropathy peripheral, vomiting and nausea in the Ipat+Pac arm and diarrhea, alopecia, peripheral sensory neuropathy, and constipation in the Pbo+Pac arm.
- Grade≥3 AEs were reported in a higher proportion of patients in the Ipat+Pac arm and the Pbo+Pac arm (57.2% vs. 49.3%). The most frequent Grade ≥3 AEs (by PT) with ≥5% incidence were diarrhea, neutrophil count decreased, neuropathy peripheral and neutropenia in the Ipat+Pac arm, and neutrophil count decreased, peripheral sensory neuropathy, neutropenia, and hypertension in the Pbo+Pac arm.
- A total of 122 deaths were reported in the safety evaluable population (Ipat+Pac: 78 patients [53.8%] vs. Pbo+Pac: 44 patients [58.7%]). The primary cause of death was progressive disease.

- Grade 5 AEs were reported in 5 patients (3.4%) in the Ipat+Pac arm and 1 patient (1.3%) in the Pbo+Pac arm. Of these, SAE (by PT) of sepsis in the Pbo+Pac arm was considered related to paclitaxel and SAE of febrile neutropenia in the Ipat+Pac arm was considered related to ipatasertib and paclitaxel by the investigator.
- SAEs were reported in a higher proportion of patients in the Ipat+Pac arm compared with the Pbo+Pac arm (20.7% vs. 14.7%). SAEs (by PT) reported in ≥1% of patients (i.e., ≥2 patients) in the Ipat+Pac arm were: diarrhea, pneumonia, pneumonitis, febrile neutropenia, and neutropenia. No SAE (by PT) was reported in more than 1 patient in the Pbo+Pac arm.
- The proportion of patients who experienced AEs leading to ipatasertib/placebo treatment discontinuation was higher in the Ipat+Pac arm compared with Pbo+Pac arm (11.7% vs. 4.0%)
- AEs led to discontinuation of paclitaxel in 29% of patients in the Ipat+Pac arm and 16% of patients in the Pbo + Pac arm.
- Selected AEs were reported in both treatment arms (Ipat+Pac: 97.2% vs. Pbo+Pac: 97.3%). Selected AEs of diarrhea, nausea, rash, erythropenia, vomiting, and oral mucositis were observed with a higher frequency (≥5% difference) in the Ipat+Pac arm compared with the Pbo+Pac arm. Peripheral neuropathy, neutropenia, asthenia, hyperglycemia, hyperlipidemia, pneumonia, pneumonitis, and thrombocytopenia were reported with <5% difference between treatment arms. Of the safety evaluable patients, for selected AEs, 51.7% experienced a highest Grade of 1–2 in the Ipat+Pac arm, 65.3% experienced a highest Grade of 1–2 in the Pbo+Pac arm, 44.1% experienced a highest Grade of 3–4 in the Ipat+Pac arm, 32% experienced a highest Grade of 3–4 in the Pbo+Pac arm, and 1.4% experienced a highest Grade of 5 in the Ipat+Pac arm.

Table 31 Safety Summary, Cohort B: HR+/HER2- Patients (Safety Evaluable Population)

Safety Summary, Cohort B: HR+/HER2- Patients, Safety Evaluable Population
Protocol: CO40016

	Placebo + Paclitaxel (N=75)	Ipatasertib + Paclitaxel (N=145)
Total number of patients with at least one AE	74 (98.7%)	144 (99.3%)
Total number of AEs	1195	2722
Total number of patients with at least one		
AE with fatal outcome	1 (1.3%)	5 (3.4%)
Serious AE	11 (14.7%)	30 (20.7%)
AE leading to discontinuation from Ipatasertib/placebo	3 (4.0%)	17 (11.7%)
AE leading to discontinuation from Paclitaxel	12 (16.0%)	42 (29.0%)
AE leading to discontinuation from any treatment	12 (16.0%)	48 (33.1%)
AE leading to Ipatasertib/placebo dose reduction	6 (8.0%)	50 (34.5%)
AE leading to Paclitaxel dose reduction	19 (25.3%)	39 (26.9%)
AE leading to dose reduction from any treatment	21 (28.0%)	68 (46.9%)
AE leading to Ipatasertib/placebo dose interruption	32 (42.7%)	67 (46.2%)
AE leading to Paclitaxel dose interruption	40 (53.3%)	77 (53.1%)
AE leading to dose interruption from any treatment	45 (60.0%)	86 (59.3%)
Grade >=3 AE	37 (49.3%)	83 (57.2%)
AE related to Ipatasertib/placebo	54 (72.0%)	134 (92.4%)
AE related to Paclitaxel	70 (93.3%)	138 (95.2%)
AE related to any treatment	70 (93.3%)	143 (98.6%)

Investigator text for AEs is coded using MedDRA version 25.1. Percentages are based on N in the column headings. Multiple occurrences of the same AE in one individual are counted only once except for 'Total number of AEs' row in which multiple occurrences of the same AE are counted separately.

Cohort C

The key safety findings for Cohort C were:

- The median duration of ipatasertib, atezolizumab, and paclitaxel treatment were 6.2, 5.7, and 6.1 months, respectively.
- The most frequent AEs (by PT) of any grade (reported in ≥30% of patients) were diarrhea, alopecia, nausea, anemia, and rash.
- Grade ≥3 AEs were reported in 60.8% of patients. The most frequent Grade ≥3 AEs (by PT) with ≥5% incidence were alanine aminotransferase increased, aspartate aminotransferase increased, neuropathy peripheral, diarrhea and neutropenia.
- A total of 50 deaths were reported in the safety evaluable population. The primary cause of death was progressive disease.
- Grade 5 AEs were reported in 4 patients (3.9%). Of these, an SAE (by PT) of pulmonary embolism was considered related to atezolizumab by the investigator.
- SAEs (by PT) reported in ≥2 patients were diarrhea, pneumonia, urinary tract infection, pyrexia, fatigue, pneumonitis, cholecystitis, dehydration, tumor necrosis, rash, febrile neutropenia, and vomiting.

- The proportions of patients who experienced AEs leading to ipatasertib, atezolizumab, and paclitaxel treatment discontinuation were 10.8%, 13.7%, and 22.5%, respectively.
- The proportion of patients who experienced at least one selected AE was 99%. The most frequent (≥30%) selected AEs (by PT) were diarrhea, rash, nausea, and anemia. Of the safety evaluable patients, for selected AEs, 48% experienced a highest Grade of 1–2, 50% experienced a highest Grade of 3–4, and 1% experienced a highest Grade of 5.

5.2.2 Adverse Events

5.2.2.1 Analysis of Adverse Events

5.2.2.1.1 Adverse Events by Incidence

Cohort A

Most patients in each treatment arm experienced at least one AE of any grade (Ipat+Pac: 162 patients [97.6%] vs. Pbo+Pac: 84 patients [96.6%]) (t_ae_A_SE). A total of 2645 and 976 AEs were reported in the Ipat+Pac arm and Pbo+Pac arm, respectively.

The SOCs in which AEs were most commonly reported (>50% of patients in either treatment arm) were: gastrointestinal disorders (Ipat+Pac: 91% vs. Pbo+Pac: 65.5%), skin and subcutaneous tissue disorders (62.7% vs. 59.8%), nervous system disorder (58.4% vs. 67.8%), general disorders and administration site conditions (57.8% vs. 49.4%). AEs (by PT) occurring in ≥10% of patients in either treatment arm are summarized in Table 33.

Table 33 Adverse Events Reported in≥10% of Patients in Either Treatment Arm (Cohort A, Safety Evaluable Population)

Adverse Events with an Incidence Rate of at Least 10% in Any Treatment Arm by Preferred Term, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA Preferred Term	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)
Diarrhoea	28 (32.2%)	141 (84.9%)
Alopecia	38 (43.7%)	78 (47.0%)
Nausea	22 (25.3%)	66 (39.8%)
Constipation	31 (35.6%)	49 (29.5%)
Anaemia	23 (26.4%)	44 (26.5%)
Vomiting	8 (9.2%)	54 (32.5%)
Neuropathy peripheral	20 (23.0%)	39 (23.5%)
Peripheral sensory neuropathy	19 (21.8%)	32 (19.3%)
Neutropenia	21 (24.1%)	28 (16.9%)

5.2.2.1.2 Adverse Events Related to Treatment Cohort A

Adverse Events Related to Ipatasertib/Placebo

Adverse events (any grade) considered by the investigator to be related to ipatasertib/placebo were reported in higher proportions of patients in the Ipat+Pac arm (152 patients [91.6%]) and the Pbo+Pac arm (63.2 patients [55%]) (t_ae_ctc_RELIPAT_A_SE).

The most common AEs (by PT, in ≥20% of patients in either arm) considered related to ipatasertib/placebo by the investigator were: diarrhea (Ipat+Pac: 81.3% vs. Pbo+Pac: 27.6%), nausea (29.5% vs. 10.3%), and vomiting (24.1% vs. 5.7%) (Table 38).

Table 38 Adverse Events Related to Ipatasertib/Placebo Treatment Reported in≥10% of Patients in Either Treatment Arm (Cohort A, Safety Evaluable Population)

Adverse Events Related to Ipatasertib/Placebo Treatment with an Incidence Rate of at Least 10% in Any Treatment Arm by Preferred Term, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

Adverse Events Related to Paclitaxel

Adverse events (any grade) considered by the investigator to be related to paclitaxel were reported in similar proportions of patients in the Ipat+Pac arm (152 patients [91.6%]) and the Pbo+Pac arm (81 patients [93.1%]) (t_ae_ctc_RELPAC_A_SE).

The most common AEs (by PT, in ≥20% of patients in either arm) considered related to paclitaxel by the investigator were: alopecia (Ipat+Pac: 47% vs. Pbo+Pac: 43.7%), diarrhea (45.2% vs. 12.6%), nausea (33.1% vs. 17.2%), neuropathy peripheral (22.9% vs, 21.8%), anemia (22.3% vs. 21.8%), peripheral sensory neuropathy (18.7% vs. 21.8%), neutropenia (16.3% vs. 23%), and vomiting (24.7% vs. 4.6%) (Table 39).

5.2.2.1.3 Adverse Events by Intensity

Cohort A

The proportion of patients who experienced Grade ≥3 AEs were similar between the Ipat+Pac arm (84 patients [50.6%]) and the Pbo+Pac arm (40 patients [46.0%]) (t_ae_CTC35_A_SE). Among all AEs in the Ipat+Pac arm, 41.6% of patients had Grade 3 AEs, 7.8% had Grade 4 AEs and 1.2% had Grade 5 AEs. Among all AEs in the Pbo+Pac arm, 37.9% of patients had Grade 3 AEs, 5.7% had Grade 4 AEs and 2.3% had Grade 5 AEs (t_ae_ctc_A_SE).

The most common Grade ≥3 AEs (by PT) reported in ≥5% of patients in either treatment arm were: diarrhea (Ipat+Pac: 9.0% vs. Pbo+Pac: 2.3%), neutrophil count decreased (4.8% vs. 5.7%), neutropenia (7.2% vs. 4.6%) (t_ae_CTC35_A_SE).

Cohort B

The proportion of patients who experienced Grade ≥3 AEs were higher between the Ipat+Pac arm (83 patients [57.2%]) and the Pbo+Pac arm (37 patients [49.3%]) (t_ae_CTC35_B_SE). Among all AEs in the Ipat+Pac arm, 48.3% of patients had Grade 3 AEs, 5.5% had Grade 4 AEs and 3.4% had Grade 5 AEs. Among all AEs in the Pbo+Pac arm, 44% of patients had Grade 3 AEs, 4.0% had Grade 4 AEs and 1.3% had Grade 5 AEs (t_ae_ctc_B_SE).

The most common Grade ≥3 AEs (by PT) reported in ≥5% of patients in either treatment arm were: diarrhea (Ipat+Pac: 11.7% vs. Pbo+Pac: 1.3%), neutrophil count decreased (9.0% vs. 8.0%), neutropenia (8.3% vs. 9.3%), neuropathy peripheral (6.9% vs. 4.0%), peripheral sensory neuropathy (2.8% vs. 5.3%), and hypertension (1.4% vs. 5.3%) (t_ae_CTC35_B_SE).

Cohort C

The number of patients who experienced Grade ≥3 AEs was 62 (60.8%) (t_ae_CTC35_C_SE). Among all AEs, 51% of patients had Grade 3 AEs, 5.9% had Grade 4 AEs and 3.9% had Grade 5 AEs (t_ae_ctc_C_SE).

The most common Grade ≥3 AEs (by PT) reported in ≥5% of patients were: diarrhea (16.7%), alanine aminotransferase increased (7.8%), asparate aminotransferase increased (7.8%), neutropenia (5.9%), and neuropathy peripheral (6.9%) (t_ae_CTC35_C_SE).

5.2.2.2 Deaths

Cohort A

A total of 132 deaths were reported in the safety evaluable population (91 patients [54.8%] in the Ipat+Pac arm, 41 patients [47.1%] in the Pbo+Pac arm) (Table 45). Of these events, the primary cause of death in both treatment arms was progressive disease (Ipat+Pac: 80 patients [87.9% of all deaths within treatment arm] vs. Pbo+Pac: 34 patients [82.9% of all deaths within treatment arm]). Deaths due to AEs were reported in 2 patients each in the Ipat+Pac and Pbo+Pac arm.

There were an additional 14 patients (Ipat+Pac: 9 patients vs. Pbo+Pac: 5 patients) who died with the reason categorized as “other”, which were non-reportable AEs per protocol (i.e., outside of the protocol-specified AE reporting period, refer to Protocol v11, Section 5.4.2.2 and Section 5.6). In the Ipat+Pac arm, 1 patient died due to pulmonary embolism, 1 patient died due to Covid-19, 1 patient died due to Covid-19 infection, 4 patients died due to unknown cause, and 2 patients’ death were identified by public records after the patient had discontinued from the study, meaning the cause of death was not reported. In the Pbo +Pac arm, the “other” causes of death were respiratory failure (1 patient), sepsis (1 patient), unknown (2 patients), and death outside the study’s reporting period (1 patient).

The majority of deaths occurred more than 28 days after the last study drug administration (Ipat+Pac: 85 patients [93.4%] vs. Pbo+Pac: 40 patients [97.6%]).

A listing (l_dd_A_SE) of deaths is appended.

Narratives for patients who died are appended.

Table 45 Summary of Deaths by Treatment (Cohort A, Safety Evaluable Population)

In the safety evaluable population, fatal AEs were reported in 2 patients (1.2%) in the Ipat+Pac arm and 2 patients (2.3%) in the Pbo+Pac arm, respectively (Table 46).

In the Ipat+Pac arm, 1 patient died due to a fatal AE (PT) of pulmonary embolism and 1 patient died due to a fatal AE (PT) of cardiopulmonary failure. The events were not considered related to any study treatment by the investigator.

In the Pbo+Pac arm, 1 patient died due to a fatal AE (PT) of tumor lysis syndrome, which was considered related to both placebo and paclitaxel and 1 patient died due to gastric cancer (unrelated to any study treatment).

A listing (l_ae_FATAL_A_SE) of AEs resulting in death is appended.

Table 46 Adverse Events Resulting in Death (Cohort A, Safety Evaluable Population)

Cohort B

A total of 122 deaths were reported in the safety evaluable population (78 patients [53.8%] in the Ipat+Pac arm, 44 patients [58.7%] in the Pbo+Pac arm) (Table 47). Of these events, the primary cause of death in both treatment arms was progressive disease (Ipat+Pac: 70 patients [89.7% of all deaths within treatment arm] vs. Pbo+Pac: 37 patients [84.1% of all deaths within treatment arm]). Deaths due to AEs were reported in 5 patients in the Ipat+Pac arm and 1 patient in the Pbo+Pac arm.

There were an additional 9 patients (Ipat+Pac: 3 patients vs. Pbo+Pac: 6 patients) who died with the reason categorized as “other”, which were non-reportable AEs per protocol (i.e., outside of the protocol-specified AE reporting period, refer to Protocol v11, Section 5.4.2.2 and Section 5.6). In the Ipat+Pac arm, 1 patient died due to pulmonary embolism, and 2 patients’ death were identified by public records after the patient had discontinued from the study, meaning the cause of death was not reported. In the Pbo +Pac arm, the “other” causes of death in 6 patients (1 in each) were: infective

pneumonia related to to SARS-COV2, deep vein thrombosis, sepsis, death, post study reporting period, and unknown causes.

The majority of deaths occurred more than 28 days after the last study drug administration (Ipat+Pac: 66 patients [84.6%] vs. Pbo+Pac: 41 patients [95.3%]).

A listing (l_dd_B_SE) of deaths is appended.

Narratives for patients who died are appended.

In the safety evaluable population, fatal AEs were reported in 5 patients (3.4%) in the Ipat+Pac arm and 1 patient (1.3%) in the Pbo+Pac arm, respectively (Table 48).

In the Ipat+Pac arm, 2 fatal AEs (PT) of general physical health deterioration and road traffic accident were reported in 1 patient, and for the remaining 4 patients, each had one fatal AE of respiratory tract infection, febrile neutropenia (only fatal AE considered related to ipatasertib and paclitaxel by investigator), pneumonia and death.

In the Pbo+Pac arm, the 1 patient died due to a fatal AE (PT) of sepsis which was considered related to paclitaxel by the investigator.

A listing (l_ae_FATAL_B_SE) of AEs resulting in death is appended.

Cohort C

A total of 50 (49.0%) deaths were reported in the safety evaluable population (Table 49). Of these, the primary cause of death was progressive disease (38 patients [76.0% of all deaths]). Deaths due to AEs were reported in 4 patients (cardiac arrest, Covid-19, pulmonary embolism, and septic shock).

There were an additional 8 patients who died with the reason categorized as “other”, which were non-reportable AEs per protocol (i.e., outside of the protocol-specified AE

reporting period, refer to Protocol v11, Section 5.4.2.2 and Section 5.6). One patient died due to septic shock, 2 patients due to Covid-19 infection, 1 patient due to failure to thrive, 2 patients due to unknown causes and 2 patients' death were identified by public records after the patient had discontinued from the study, meaning the cause of death was not reported.

The majority of deaths occurred more than 28 days after the last study drug administration (43 patients [86.0%]).

One patient died due to an AE (pneumonia) after the 28-day reporting period for ipatasertib, which was not related to any study medications. All study medications had been previously discontinued due to the AE of pneumonitis, which was reported as related to atezolizumab.

A listing (l_dd_C_SE) of deaths is appended.

Narratives for patients who died are appended.

In the safety evaluable population, fatal AEs were reported in 4 patients (3.9%) (Table 50).

Four (1 in each patient) fatal AEs (PT) were: pulmonary embolism (considered related to atezolizumab by the investigator), suspected Covid-19, cardiac arrest, and pneumonia.

A listing (l_ae_FATAL_C_SE) of AEs resulting in death is appended.

5.2.2.3 Serious Adverse Events

Cohort A

A similar proportion of patients in the Ipat+Pac arm (34 patients [20.5%]) and Pbo+Pac arm (20 patients [23.0%]) experienced SAEs (t_ae_SER_A_SE).

Serious adverse events (by PT) reported in ≥1% of patients (i.e., ≥2 patients) in the Ipat+Pac arm were: diarrhea (3.6%), febrile neutropenia (1.8%), pulmonary embolism (1.8%), pneumonia (1.2%), nausea (1.2%), and vomiting (1.2%). Six SAEs (by PT) were reported in more than 1 patient in the Pbo+Pac arm: pneumonia (4.6%), and pleural

effusion (2.3%) (t_ae_pt_1P_SER_A_SE). Diarrhea and pneumonia were SAEs that occurred with a ≥2% difference between treatment arms (t_ae_pt_2D_SER_A_SE).

The proportions of patients with SAEs considered related to ipatasertib/placebo by the investigator was higher in the Ipat+Pac arm (Ipat + Pac: 15 patients [9.0%] vs. Pbo+Pac: 3 patients [3.4%]).

In the Ipat+Pac arm, SAEs related to ipatasertib (by PT) reported in ≥1% of patients (i.e., ≥2 patients) was diarrhea (3.6%) (t_ae_ctc_SER_RELIPAT_A_SE). SAEs related to paclitaxel (by PT) reported in ≥1% of patients were nausea (1.2%), vomiting (1.2%), and febrile neutropenia (1.8%) (t_ae_ctc_SER_RELPAC_A_SE).

In the Pbo+Pac arm, there were no SAEs related to placebo reported by the investigator in ≥2 patients. SAEs related to paclitaxel were reported by the investigator in 2 patients (2.3%) for pneumonia (PT).

One SAE considered related to ipatasertib/placebo (by PT) and occurring in ≥2% of patients in either treatment arm was diarrhea (Ipat+Pac: 6 patients [3.6%] vs. Pbo+Pac: 0 patient) (t_ae_pt_2P_SER_RELIPAT_A_SE). One SAE considered related to paclitaxel (by PT) and occurring in ≥2% of patients in either treatment arm was pneumonia (Ipat+Pac: 0 patient vs. Pbo+Pac: 2 patients [2.3%]) (t_ae_pt_2P_SER_RELPAC_A_SE).

A summary of SAEs by highest NCI CTCAE grade (t_ae_ctc_SER_A_SE) and a listing of SAEs by patient (l_ae_ser_A_SE) are provided.

Narratives for patients who experienced SAEs during the study are appended.

Cohort B

A higher proportion of patients in the Ipat+Pac arm (30 patients [20.7%]) and Pbo+Pac arm (11 patients [14.7%]) experienced SAEs (t_ae_SER_B_SE).

Serious adverse events (by PT) reported in ≥1% of patients (i.e., ≥2 patients) in the Ipat+Pac arm were: diarrhea (2.8%), febrile neutropenia (1.4%), pneumonia (1.4%), neutropenia (1.4%), and pneumonitis (1.4%). No SAE (by PT) was reported in more than 1 patient in the Pbo+Pac arm(t_ae_pt_1P_SER_B_SE). There were no SAEs that occurred with a ≥2% difference between treatment arms (t_ae_pt_2D_SER_B_SE).

The proportions of patients with SAEs considered related to ipatasertib/placebo by the investigator was similar in the Ipat+Pac arm and Pbo+Pac arm (Ipat + Pac: 9 patients [6.2%] vs. Pbo+Pac: 4 patients [5.3%]).

In the Ipat+Pac arm, SAEs related to ipatasertib (by PT) reported in ≥1% of patients (i.e., ≥2 patients) were diarrhea (2.8%) and febrile neutropenia (1.4%) (t_ae_ctc_SER_RELIPAT_B_SE). SAEs related to paclitaxel (by PT) reported in ≥1% of patients were febrile neutropenia (1.4%) and neutropenia (1.4%) (t_ae_ctc_SER_RELPAC_B_SE).

In the Pbo+Pac arm, no SAEs related to placebo or paclitaxel were reported by the investigator in ≥2 patients.

One SAE considered related to ipatasertib/placebo (by PT) and occurring in ≥2% of patients in either treatment arm was diarrhea (Ipat+Pac: 4 patients [2.8%] vs. Pbo+Pac: 1 patient [1.3%]) (t_ae_pt_2P_SER_RELIPAT_B_SE). There were no SAEs (by PT) considered related to paclitaxel that were occurring in ≥2% of patients in either treatment arm (t_ae_pt_2P_SER_RELPAC_B_SE).

A summary of SAEs by highest NCI CTCAE grade (t_ae_ctc_SER_B_SE) and a listing of SAEs by patient (l_ae_ser_B_SE) are provided.

Narratives for patients who experienced SAEs during the study are appended.

Cohort C

The total number of patients with at least one SAE was 29 (28.4%) (t_ae_SER_C_SE).

Serious adverse events (by PT) reported in ≥2 patients were: diarrhea (3.9%), pyrexia (3.9%), pneumonia (2.9%), urinary tract infection (2.9%), cholecystitis (2.0%), dehydration (2.0%), fatigue (2.0%), febrile neutropenia (2.0%), pneumonitis (2.0%), rash (2.0%), tumor necrosis (2.0%), and vomiting (2.0%) (t_ae_pt_1P_SER_C_SE).

Twelve patients (11.8%) experienced SAEs considered related to ipatasertib by the investigator.

Serious adverse events related to ipatasertib (by PT) and reported in ≥2 patients were diarrhea (2.9%), dehydration (2.0%), and tumor necrosis (2.0%) (t_ae_ctc_SER_RELIPAT_C_SE). SAEs related to paclitaxel (by PT) reported in ≥2 patients were diarrhea (2.0%), febrile neutropenia (2.0%), urinary tract infection (2.0%), dehydration (2.0%), and tumor necrosis (2.0%) (t_ae_ctc_SER_RELPAC_C_SE). SAEs related to atezolizumab (by PT) reported in ≥2 patients were diarrhea (2.0%), pneumonitis (2.0%), dehydration (2.0%), tumor necrosis (2.0%), rash (2.0%) (t_ae_ctc_SER_RELATZ_C_SE).

One SAE considered related to ipatasertib (by PT) and occurring in ≥2% of patients in either treatment arm was diarrhea (3 patients [2.9%]) (t_ae_pt_2P_SER_RELIPAT_C_SE). There were no SAEs (by PT) considered related to paclitaxel or atezolizumab that were occurring in ≥2% of patients in either treatment arm (t_ae_pt_2P_SER_RELPAC_C_SE, t_ae_pt_2P_SER_RELATZ_C_SE).

A summary of SAEs by highest NCI CTCAE grade (t_ae_ctc_SER_C_SE), by PT (t_ae_pt_SER_C_SE), and a listing of SAEs by patient (l_ae_ser_C_SE) are provided.

Narratives for patients who experienced SAEs during the study are appended.

5.2.2.4 Adverse Events That Led to Withdrawal of Treatment Cohort A

The proportion of patients who experienced AEs leading to ipatasertib/placebo treatment discontinuation was higher in the Ipat+Pac (17 patients [10.2%]) and Pbo+Pac arm (6 patients [6.9%]) (t_ae_DSCIPAT_A_SE).

Adverse events (by PT) leading to ipatasertib discontinuation occurring in ≥1% of patients (i.e., ≥2 patients) in the Ipat+Pac arm were diarrhea (3.6%), pulmonary embolism (1.2%), hyperglycemia (1.2%) (Table 51). In the Pbo+Pac arm, AE (by PT) leading to placebo discontinuation in more than 1 patient was neuropathy peripheral (2.3%).

Among AEs leading to ipatasertib/placebo discontinuation, Grade 3 events were reported in 6% of patients in the Ipat+Pac arm and 4.6% of patients in the Pbo+Pac arm, respectively (t_ae_ctc_DSCIPAT_A_SE). One (0.6%) patient in the Ipat+Pac arm had Grade 5 AE (PT: pulmonary embolism) leading to treatment discontinuation of both ipatasertib and paclitaxel (see Deaths). Two patients in the Ipat+Pac arm had Grade 4 events (PTs: large intestine perforation and neutrophil count decreased). The rest of AEs leading to ipatasertib/placebo discontinuation were reported as Grade 2.

Table 51 Adverse Events Leading to Ipatasertib/Placebo Discontinuation (Cohort A, Safety Evaluable Population)

Adverse events leading to discontinuation of paclitaxel was reported in 25 patients (15.1%) in the Ipat + Pac arm and in 14 patients (16.1%) in the Pbo+Pac arm (t_ae_DSCPAC_A_SE). The most common AEs leading to paclitaxel discontinuation were reported in the SOC of nervous system disorders (Ipat+Pac: 7.8% vs. Pbo+Pac: 10.3%).

The AEs (by PT) leading to paclitaxel discontinuation occurring in ≥ 2 of patients in either treatment arm were: neuropathy peripheral (Ipat + Pac: 4.8% vs. Pbo+Pac: 4.6%), peripheral sensory neuropathy (2.4% vs. 2.3%), polyneuropathy (0.6% vs. 3.4%), diarrhea (1.8% vs. 0), and pulmonary embolism (1.2% vs. 0) (Table 52).

Among patients with AEs leading to paclitaxel discontinuation, the majority (11.4%) had Grade ≥ 3 AEs by highest NCI CTCAE grade in the Ipat+Pac arm (t_ae_ctc_DSCPAC_A_SE). One patient (0.6%) in the Ipat+Pac arm had Grade 5 AE (PT: pulmonary embolism) leading to treatment discontinuation of both ipatasertib and paclitaxel (see Deaths). One patient (1.1%) in the Pbo+Pac arm had Grade 5 AE (PT: tumor lysis syndrome) leading to paclitaxel and placebo discontinuation.

A listing (l_ae_DSCANY_A_SE) of all AEs leading to any study treatment discontinuation is appended.

Narratives for patients who experienced AEs leading to study treatment discontinuation are appended.

Cohort B

The proportion of patients who experienced AEs leading to ipatasertib/placebo treatment discontinuation was higher in the Ipat+Pac arm (17 patients [11.7%]) compared with Pbo+Pac arm (3 patients [4%]) (t_ae_DSCIPAT_B_SE).

Adverse events (by PT) leading to ipatasertib discontinuation occurring in ≥1% of patients (i.e., ≥2 patients) in the Ipat+Pac arm were diarrhea (2.8%), febrile neutropenia (1.4%), and hyperglycemia (1.4%) (Table 53). In the Pbo+Pac arm, no AEs (by PT) leading to placebo discontinuation were reported in more than 1 patient.

Among AEs leading to ipatasertib/placebo discontinuation, Grade 3 events were reported in 4.8% of patients in the Ipat+Pac arm and 2.7% of patients in the Pbo+Pac arm (t_ae_ctc_DSCIPAT_B_SE). Three (2.1%) patients in the Ipat+Pac arm had Grade 5 AEs (PT: febrile neutropenia, death, pneumonia) leading to treatment discontinuation of both ipatasertib and paclitaxel (see Deaths). No patients in the Ipat+Pac arm had Grade 4 events that led to discontinuation of study treatment. The rest of AEs leading to ipatasertib/placebo discontinuation were reported as Grade 1 or Grade 2.

Adverse events leading to discontinuation of paclitaxel were reported in 42 patients (29%) in the Ipat+Pac arm and in 12 patients (16%) in the Pbo+Pac arm (t_ae_DSCPAC_B_SE). The most common AEs leading to paclitaxel discontinuation were reported in the SOC of nervous system disorders (Ipat+Pac: 16.6% vs. Pbo+Pac: 9.3%).

The AEs (by PT) leading to paclitaxel discontinuation occurring in ≥ 2 of patients in either treatment arm were: neuropathy peripheral (Ipat + Pac: 6.9% vs. Pbo+Pac: 1.3%), peripheral sensory neuropathy (4.8% vs. 6.7%), neurotoxicity (1.4% vs. 0), polyneuropathy (1.4% vs. 0), febrile neutropenia (2.1% vs. 0), neutropenia (2.1% vs. 0), and neutrophil count decreased (1.2% vs. 2.7%) (Table 54).

Among patients with AEs leading to paclitaxel discontinuation, the majority (15.2%) had Grade ≥ 3 AEs by highest NCI CTCAE grade in the Ipat+Pac arm (t_ae_ctc_DSCPAC_B_SE). Three patients (2.1%) in the Ipat+Pac arm (PTs: febrile neutropenia, death, pneumonia) and 1 patient (1.3%) in Pbo+Pac arm (PT: sepsis) had Grade 5 AEs leading to study treatment discontinuation (see Deaths).

A listing (l_ae_DSCANY_B_SE) of all AEs leading to any study treatment discontinuation is appended.

Narratives for patients who experienced AEs leading to study treatment discontinuation are appended.

Cohort C

The total number of patients with at least one AE leading to ipatasertib treatment discontinuation was 11 (10.8%) (t_ae_DSCIPAT_C_SE).

Adverse events (by PT) leading to ipataserib discontinuation occurring in ≥2 patients were aspartate aminotransferase increased, alanine aminotransferase increased, and autoimmune hepatitis (Table 55).

Among AEs leading to ipatasertib discontinuation, Grade 3 events were reported in 6.9% of patients (t_ae_ctc_DSCIPAT_C_SE). Two (2.0%) patients had Grade 5 AE (PTs: pulmonary embolism, suspected Covid-19) leading to treatment discontinuation of ipatasertib, atezolizumab, and paclitaxel (see Deaths). One patient had Grade 4 event (PT: diabetic ketoacidosis). The remaining one AE leading to ipatasertib discontinuation was reported as Grade 1.

Table 55 Adverse Events Leading to Ipatasertib Discontinuation (Cohort C, Safety Evaluable Population)

Adverse Events Leading to Ipatasertib Discontinuation by Preferred Term, Cohort C: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA Preferred Term	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Aspartate aminotransferase increased	3 (2.9%)
Alanine aminotransferase increased	2 (2.0%)
Autoimmune hepatitis	2 (2.0%)

The total number of patients with at least one AE leading to discontinuation of paclitaxel was 23(22.5%) (t_ae_DSCPAC_C_SE). The most common AEs leading to paclitaxel discontinuation were reported in the SOC of nervous system disorders (11.8%).

The AEs (by PT) leading to paclitaxel discontinuation occurring in ≥ 2 of patients were: neuropathy peripheral (6.9%), and polyneuropathy (2%), (Table 56).

Among patients with AEs leading to paclitaxel discontinuation, 10.8% had Grade ≥ 3 AEs by highest NCI CTCAE grade (t_ae_ctc_DSCPAC_C_SE). Two patients (2.0%) had Grade 5 AE

(PTs: pulmonary embolism, suspected Covid-19) leading to treatment discontinuation of ipatasertib, atezolizumab, and paclitaxel (see Deaths).

A listing (l_ae_DSCANY_C_SE) of all AEs leading to any study treatment discontinuation is appended.

Narratives for patients who experienced AEs leading to study treatment discontinuation are appended.

5.2.2.5 Adverse Events That Led to Dose Modification

Cohort A

A higher proportion of patients experienced AEs leading to ipatasertib/placebo dose reduction in the Ipat+Pac arm (46 patients [27.7%]) compared with the Pbo+Pac arm (7 patients [8%]), with the difference mainly due to the SOC of gastrointestinal disorders (Ipat+Pac arm: 16.9% vs. Pbo+Pac arm: 2.3%) (t_ae_DSRIPAT_A_SE).

The most commonly reported (≥2% of patients in either arm) AEs by PT leading to dose reduction of ipatasertib/placebo were diarrhea (13.9% vs. 2.3%), hyperglycemia (2.4% vs. 2.3%), alanine aminotransferase increased (2.4% vs. 1.1%), aspartate aminotransferase increased (2.4% vs. 1.1%), neutropenia (2.4% vs. 0), and neutrophil count decreased (1.2% vs. 2.3%) (Table 58). There were 15.1% of patients in the Ipat+Pac arm and 4.6% of patients in the Pbo+Pac arm that experienced Grade 3–4 AEs leading to ipatasertib/placebo dose reduction (t_ae_ctc_DSRIPAT_A_SE).

Table 58 Adverse Events Leading to Dose Reduction of Ipatasertib/Placebo (Cohort A, Safety Evaluable Population)

Adverse Events Leading to Dose Reduction of Ipatasertib/Placebo by Preferred Term, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

08MAY2023 6:11 Page 1 of 1

A higher proportion of patients experienced AEs leading to ipatasertib/placebo dose interruption in the Ipat+Pac arm: (73 patients [44%]) compared with the Pbo+Pac arm (26 patients [29.9%]), with only the SOC of gastrointestinal disorders with a ≥ 5% difference between treatment arms (Ipat+Pac: 13.9% vs. Pbo+Pac: 3.4%) (t_ae_DSIIPAT_A_SE). The most commonly reported (≥5% of patients in either arm) AEs by PTs leading to dose interruption of ipatasertib/placebo was diarrhea (8.4% vs. 0), neutropenia (6% vs. 4.6%) (t_ae_pt_DSIIPAT_A_SE). There were 19.3% of patients in the Ipat+Pac arm and 23% of patients in the Pbo+Pac arm that experienced Grade 3-4 AEs leading to ipatasertib/placebo dose interruption (t_ae_ctc_DSIIPAT_A_SE).

A higher proportion of patients experienced AEs leading to paclitaxel dose reduction in the Ipat+Pac arm (34 patients [20.5%]) compared with Pbo+Pac arm (9 patients [10.3%]) (t_ae_DSRPAC_A_SE). Overall, the most commonly reported (≥2% of patients in either arm) AEs by PTs leading to dose reduction of paclitaxel were neuropathy peripheral (3% vs. 1.1%), peripheral sensory neuropathy (3% vs. 2.3%), neutropenia (3% vs. 0), and neutrophil count decreased (1.8% vs. 2.3%) (Table 59). There were 9.6% of patients in the Ipat+Pac arm and 3.4% of patients in the Pbo+Pac arm that experienced Grade 3–4 AEs leading to paclitaxel dose reduction (t_ae_ctc_DSRPAC_A_SE).

The total number of patients who experienced at least one AE leading to ipatasertib dose interruption was 59 (57.8%), mainly due to the SOC of gastrointestinal disorders (t_ae_DSIIPAT_C_SE). The most commonly reported (≥5% of patients) AEs (by PTs) leading to dose interruption of ipatasertib were diarrhea (14.7%), neutropenia (9.8%), alanine aminotransferase increased (5.9%), aspartate aminotransferase increased (5.9%), pyrexia (5.9%), and rash (5.9%) (t_ae_pt_DSIIPAT_C_SE). There were 31.4% of patients that experienced Grade 3–4 AEs leading to ipatasertib dose interruption (t_ae_ctc_DSIIPAT_C_SE).

The total number of patients who experienced at least one AE leading to paclitaxel dose reduction was 25 (24.5%) (t_ae_DSRPAC_C_SE). Overall, the most commonly reported (≥2% of patients) AEs by PTs leading to dose reduction of paclitaxel were neuropathy peripheral (7.8%), polyneuropathy (2.9%), neutrophil count decreased (2.9%), alanine aminotransferase increased (2.0%), neutropenia (2.9%), and diarrhea (2.0%) (Table 63). There were 7.8% of patients that experienced Grade 3–4 AEs leading to paclitaxel dose reduction (t_ae_ctc_DSRPAC_C_SE).

Table 63 Adverse Events Leading to Dose Reduction of Paclitaxel (Cohort C, Safety Evaluable Population)

Adverse Events Leading to Dose Reduction of Paclitaxel by Preferred Term, Cohort C: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA Preferred Term	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Neuropathy peripheral	8 (7.8%)
Neutropenia	3 (2.9%)
Neutrophil count decreased	3 (2.9%)
Polyneuropathy	3 (2.9%)
Alanine aminotransferase increased	2 (2.0%)
Diarrhoea	2 (2.0%)
Anaemia	1 (1.0%)
Aspartate aminotransferase increased	1 (1.0%)
Dizziness	1 (1.0%)
Nail disorder	1 (1.0%)
Oedema peripheral	1 (1.0%)
Visual impairment	1 (1.0%)
Weight decreased	1 (1.0%)

08MAY2023 6:14 Page 1 of 1

The total number of patients who experienced at least one AE leading to paclitaxel dose interruption was 67 (65.7%), mainly due to the SOC of blood and lymphatic system disorders and infections and infestations (t_ae_DSIPAC_C_SE). The most commonly reported (≥5% of patients) AEs (by PTs) leading to dose interruption of paclitaxel were neutropenia (15.7%), diarrhea (8.8%), alanine aminotransferase increased (7.8%), aspartate aminotransferase increased (6.9%), pyrexia (6.9%) and neutrophil count

decreased (5.9%) (t_ae_pt_DSIPAC_C_SE). There were 35.3% of patients that experienced Grade 3–4 AEs leading to paclitaxel dose interruption (t_ae_ctc_DSIPAC_C_SE).

The total number of patients who experienced at least one AE leading to atezolizumab dose interruption was 53 (52%), mainly due to the SOC of infections and infestations (t_ae_DSIATZ_C_SE). The most commonly reported (≥5% of patients) AEs (by PTs) leading to dose interruption of atezolizumab were neutropenia (6.9%), aspartate aminotransferase increased (6.9%), pyrexia (5.9%) and rash (5.9%) (t_ae_pt_DSIATZ_C_SE). There were 26.5% of patients that experienced Grade 3–4 AEs leading to atezolizumab dose interruption (t_ae_ctc_DSIATZ_C_SE).

A listing (l_ae_DSMANY_C_SE) of all AEs leading to dose reduction or interruption of any study treatment is appended.

5.2.2.6 Selected Adverse Events

Selected AEs in the study included identified and potential toxicities based on nonclinical toxicology information, clinical experience with ipatasertib, and AEs known to be associated with the PI3K/Akt pathway inhibitor class.

Selected AEs were identified by grouping MedDRA Standardized MedDRA Queries and PTs of similar medical concept together to AE grouped terms (see Safety Analysis). The list of Selected AE definition (MedDRA_GroupTerms_Selected_AE_CO40016) is provided.

An overview of selected AEs of the safety evaluable population is provided for Cohort A (Table 64), Cohort B (Table 65), and Cohort C (Table 66). Selected AEs were reported in both treatment arms of Cohort A (Ipat+Pac: 94.6% vs. Pbo+Pac: 90.8%) and Cohort B (Ipat+Pac: 97.2% vs. Pbo+Pac: 97.3%). For Cohort C, selected AEs were reported in 99% of patients, and results for immune-mediated selected AEs associated with atezolizumab (i.e., immune-mediated rash, immune-mediated pneumonitis, etc.) are appended (t_aesi_C_SE, t_aesi_ctc_C_SE).

In the following Sections 5.2.2.6.1 to 5.2.2.6.17, results are discussed as clinically relevant for each selected AE category. However, complete analyses were conducted for all selected AE categories, and are appended.

Listings of all selected AEs for Cohort A (l_aesi_A_SE), Cohort B (l_aesi_B_SE), and Cohort C (l_aesi_C_SE) are appended.

5.2.2.6.1 Diarrhea

Cohort A

The proportion of patients with selected AEs in the diarrhea category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (141 patients [84.9%] vs. 28 patients [32.2%]) (t_aesi_A_SE).

The majority of patients who experienced diarrhea had events that were Grade 1–2 in intensity. Grade 3 diarrhea events were reported in 15 patients (9.0%) in the Ipat+Pac

arm and 2 patients (2.3%) in the Pbo+Pac arm, respectively. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_A_SE).

Most diarrhea events (PT: diarrhea) were non-serious, with SAEs (Grade 2 or 3) occurring in 6 patients (3.6%) in the Ipat+Pac arm and no patient in the Pbo+Pac arm (t_aesi_ctc_SER_A_SE, l_aesi_A_SE).

A low number of patients discontinued ipatasertib/placebo treatment due to diarrhea (Ipat+Pac: 6 patients [3.6%] vs. Pbo+Pac: 0 patient) (t_aesi_ctc_DSCIPAT_A_SE). Three patients (1.8%) in the Ipat+Pac arm discontinued paclitaxel treatment due to diarrhea (t_aesi_ctc_DSCPAC_A_SE). In the Ipat+Pac arm, diarrhea led to ipatasertib dose reduction and dose interruption in 13.9% of patients and in 8.4% of patients, respectively. Diarrhea led to paclitaxel dose reduction in 1.2% of patients and dose interruption in 4.2% of patients (t_aesi_ctc_DSRPAC_A_SE, t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSIPAC_A_SE).

Overall, the vast majority of diarrhea events had resolved (97.7% vs. 96.4%) (t_aesiout_A_SE).

In this study, to improve diarrhea management and patient experiences, if allowed locally, prophylactic loperamide (racecadotril as used in Europe) for diarrhea management was mandated in the first cycle, dose adjusted as necessary, and continued as per investigator judgment (see Prior and Concomitant Therapy). A similar proportion of patients in each treatment arm received at least one dose of prophylactic loperamide during the study period (Ipat+Pac: 83.3% vs. Pbo+Pac: 87.4%) (see Prior And Concomitant Therapy, t_cm_lop_A_IT).

Narratives for patients who experienced Grade ≥3 diarrhea events are appended.

Cohort B

The proportion of patients with selected AEs in the diarrhea category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (126 patients [86.9%] vs. 30 patients [40.0%]) (t_aesi_B_SE).

The majority of patients who experienced diarrhea had events that were Grade 1–2 in intensity. Grade 3 diarrhea were reported in 11.7% of patients in the Ipat+Pac arm and 1.3% of patients in the Pbo+Pac arm, respectively. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_B_SE).

Most diarrhea events were non-serious, with SAEs (Grade 3 or 4) occurring in 4 patients (2.8%) in the Ipat+Pac arm and 1 patient (1.3%) in the Pbo+Pac arm (t_aesi_ctc_SER_B_SE).

A low number of patients discontinued ipatasertib/placebo treatment due to diarrhea (Ipat+Pac: 4 patients [2.8%] vs. Pbo+Pac: 1 patient [1.3%]) (t_aesi_ctc_DSCIPAT_B_SE). One patient (0.7%) in the Ipat+Pac arm discontinued paclitaxel treatment due to diarrhea

(t_aesi_ctc_DSCPAC_B_SE). In the Ipat+Pac arm, diarrhea led to ipatasertib dose reduction and dose interruption in 22.8% of patients and in 9.7% of patients, respectively. Diarrhea led to paclitaxel dose reduction in 2.8% of patients and dose interruption in 6.9% of patients (t_aesi_ctc_DSRPAC_B_SE, t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSIPAC_B_SE).

Overall, the vast majority of diarrhea events had resolved (97.6% vs. 98.5%) (t_aesiout_B_SE).

In this study, to improve diarrhea management and patient experiences, if allowed locally, prophylactic loperamide (racecadotril as used in Europe) for diarrhea management was mandated in the first cycle, dose adjusted as necessary, and continued as per investigator judgment (see Prior and Concomitant Therapy). A similar proportion of patients in each treatment arm received at least one dose of prophylactic loperamide during the study period (Ipat+Pac: 79.5% vs. Pbo+Pac: 77.6%) (see Prior And Concomitant Therapy, t_cm_lop_B_IT).

Narratives for patients who experienced Grade ≥3 diarrhea events are appended.

Cohort C

The number of patients with selected AEs in the diarrhea category was 86 patients [84.3%] (t_aesi_C_SE).

The majority of patients who experienced diarrhea had events that were Grade 1–2 in intensity. Grade 3 diarrhea was reported in 16.7% of patients. No events of Grade 4 or Grade 5 intensity were reported (t_aesi_ctc_C_SE).

Most diarrhea events were non-serious, with SAEs (Grade 1 and Grade 3) occurring in 4 patients (3.9%) (t_aesi_ctc_SER_C_SE). No patients had discontinued ipatasertib or paclitaxel treatment due to diarrhea (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCPAC_C_SE). One patient (1.0%) discontinued atezolizumab treatment due to diarrhea (t_aesi_ctc_DSCATZ_C_SE). Diarrhea led to ipatasertib dose reduction and dose interruption in 20.6% of patients and in 14.7% of patients, respectively. Diarrhea led to paclitaxel dose reduction in 2.0% of patients and dose interruption in 8.8% of patients. Diarrhea led to atezolizumab interruption in 4.9% of patients (t_aesi_ctc_DSRPAC_C_SE, t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE, t_aesi_ctc_DSIATZ_C_SE).

Overall, the vast majority of diarrhea events had resolved (97.2%) (t_aesiout_C_SE).

In this study, to improve diarrhea management and patient experiences, if allowed locally, prophylactic loperamide (racecadotril as used in Europe) for diarrhea management was mandated in the first cycle, dose adjusted as necessary, and continued as per investigator judgment (see Prior and Concomitant Therapy). The

proportion of patients who received at least one dose of prophylactic loperamide during the study period was 83.3% (see Prior And Concomitant Therapy, t_cm_lop_C_IT).

Narratives for patients who experienced Grade ≥3 diarrhea events are appended.

5.2.2.6.2 Rash

Cohort A

The proportion of patients with selected AEs of rash was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (50 patients [30.1%] vs. 19 patients [21.8%], respectively). The most commonly reported PT within this category was rash (15.7% vs. 12.6%) (t_aesi_A_SE).

The majority of rash events were Grade 1 or Grade 2, with Grade 3 events reported in 1.2% of patients in the Ipat+Pac arm and 1.1% of patients in the Pbo+Pac arm. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_A_SE). One patient in the Ipat+Pac arm discontinued ipatasertib due to rash (t_aesi_ctc_DSCIPAT_A_SE). One patient each in the Ipat+Pac arm and Pbo+Pac arm also discontinued paclitaxel due to rash (t_aesi_ctc_DSCPAC_A_SE).

There were no serious events of rash reported (t_aesi_ctc_SER_A_SE). Two patients (1.2%) had ipatasertib dose reduction and 6 patients (3.6%) had ipatasertib dose interruption in the Ipat+Pac arm due to rash (t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSIIPAT_A_SE). No rash events led to paclitaxel dose reduction in any patients (t_aesi_ctc_DSRPAC_A_SE). Paclitaxel dose interruption due to rash was reported in 4.2% of patients in the Ipat+Pac arm and was not reported in any patients in the Pbo+Pac arm (t_aesi_ctc_DSIPAC_A_SE).

Overall, the majority of rash events in both treatment arms had resolved (Ipat+Pac: 88.6% vs. Pbo+Pac: 87.5%) (t_aesiout_A_SE).

Narratives for patients who experienced Grade ≥3 rash events are appended.

Cohort B

The proportion of patients with selected AEs in the rash category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (47 patients [32.4%] vs. 18 patients [24.0%]). The most commonly reported PT within this category was rash (21.4% vs. 12.0%) (t_aesi_B_SE).

The majority of the rash events were Grade 1 or Grade 2, with Grade 3 events reported in 4.1% of patients in the Ipat+Pac arm. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_B_SE). No patients discontinued ipatasertib due to rash (t_aesi_ctc_DSCIPAT_B_SE). One patient in the Ipat+Pac arm discontinued paclitaxel due to rash (t_aesi_ctc_DSCPAC_B_SE).

There were no serious rash events reported (t_aesi_ctc_SER_B_SE). Five patients (3.4%) had ipatasertib dose reduction and 8 patients (5.5%) had ipatasertib dose interruption in

the Ipat+Pac arm due to rash (t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSIIPAT_B_SE). No rash events led to paclitaxel dose reduction in any patients (t_aesi_ctc_DSRPAC_B_SE). Paclitaxel dose interruption due to rash were reported in 4.8% of patients in the Ipat+Pac arm and 4.0% patients in the Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_B_SE).

Overall, the majority of rash events in both treatment arms had resolved (Ipat+Pac: 91.0% vs. Pbo+Pac: 90.3%) (t_aesiout_B_SE).

Narratives for patients who experienced Grade ≥3 rash events are appended.

Cohort C

The proportion of patients with selected AEs in the rash category was 45.1%. The most commonly reported PT within this category was rash (30.4%) (t_aesi_C_SE).

The majority of rash events were Grade 1 or Grade 2, with Grade 3 events reported in 4.9% of patients. No events of Grade 4 or Grade 5 intensity were reported (t_aesi_ctc_C_SE). No patients discontinued ipatasertib, atezolizumab, or paclitaxel due to rash (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE, t_aesi_ctc_DSCPAC_C_SE).

Two serious rash events (Grade 2 or Grade 3) were reported (t_aesi_ctc_SER_C_SE). One patient (1.0%) had ipatasertib dose reduction and 10 patients (9.8%) had ipatasertib dose interruption due to rash (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSIIPAT_C_SE). No rash events led to paclitaxel dose reduction in any patients (t_aesi_ctc_DSRPAC_C_SE). Paclitaxel dose interruption due to rash was reported in 6.9% of patients (t_aesi_ctc_DSIPAC_C_SE). Atezolizumab dose interruption due to rash was reported in 9.8% of patients (t_aesi_ctc_DSIATZ_C_SE).

Overall, the majority of the rash events had resolved (87.9%) (t_aesiout_C_SE).

Narratives for patients who experienced Grade ≥3 rash events are appended.

5.2.2.6.3 Hyperglycemia

Cohort A

The proportions of patients with selected AEs in the category of hyperglycemia was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (31 patients [18.7%] vs. 10 patients [11.5%]). In the safety evaluable population, the PTs reported within this category were hyperglycemia (18.7% vs. 10.3%), glucose tolerance impaired (1.2% vs. 0), blood glucose increased (0 vs. 1.1%), glycosylated hemoglobin abnormal (0.6% vs. 0) and diabetes mellitus (0.6% vs. 0) (t_aesi_A_SE).

The majority of cases of hyperglycemia were Grade 1 and 2. Grade 3–4 hyperglycemia was reported in 1.8% of patients in the Ipat+Pac arm. In the Ipat+Pac arm, 2 patients experienced Grade 3 hyperglycemia and 1 patient experienced Grade 4 hyperglycemia. No events of Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_A_SE).

One patient (0.6%) in the Ipat+Pac arm experienced a serious hyperglycemia event (Grade 4, PT: hyperglycemia) (t_aesi_SER_A_SE, t_aesi_ctc_SER_A_SE).

In the Ipat+Pac arm, 2 patients discontinued from ipatasertib treatment due to hyperglycemia. No patients discontinued paclitaxel treatment due to hyperglycemia (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE).

In the Ipat+Pac arm, hyperglycemia led to ipatasertib dose reduction and dose interruption in 4 patients (2.4%) and 8 patients (4.8%), respectively, and paclitaxel dose reduction and dose interruption in 1 patient (0.6%) and 2 patients (1.2%), respectively (t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSRPAC_A_SE, t_aesi_ctc_DSIPAC_A_SE). In the Pbo+Pac arm, hyperglycemia led to paclitaxel dose interruption in 2.3% of patients (t_aesi_ctc_DSIPAC_A_SE).

Overall, the majority of hyperglycemia events had resolved (Ipat+Pac: 87.1% vs. Pbo+Pac: 70.6%).

Narratives for patients who experienced Grade ≥3 hyperglycemia events are appended.

Cohort B

The proportions of patients with selected AEs in the category of hyperglycemia were similar in the Ipat+Pac arm compared with the Pbo+Pac arm (23 patients [15.9%] vs. 10 patients [13.3%]). In the safety evaluable population, the PTs reported within this category were hyperglycemia (13.1% vs. 13.3%), blood glucose increased (1.4% vs. 0), diabetes mellitus (0.7% vs. 0), glycosylated hemoglobin increased (0.7% vs. 0), and type 2 diabetes mellitus (0.7% vs. 0) (t_aesi_B_SE).

The majority of cases of hyperglycemia were Grade 1 and 2. Grade 3 hyperglycemia was reported in 2.1% of patients in the Ipat+Pac arm. No events of Grade 4 or 5 intensity were reported in either treatment arm (t_aesi_ctc_B_SE).

One patient (0.7%) in the Ipat+Pac arm experienced a serious hyperglycemia event (Grade 3, PT: hyperglycemia) (t_aesi_SER_B_SE, t_aesi_ctc_SER_B_SE).

In the Ipat+Pac arm, 2 patients (1.4%) discontinued from ipatasertib treatment due to hyperglycemia (t_aesi_ctc_DSCIPAT_B_SE). One patient (0.7%) in the Ipat+Pac arm and none in the Pbo+Pac arm discontinued paclitaxel due to hyperglycemia (t_aesi_ctc_DSCPAC_B_SE).

In the Ipat+Pac arm, hyperglycemia led to ipatasertib dose reduction and dose interruption in 3 patients (2.1%) and 5 patients (3.4%), respectively (t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSIIPAT_B_SE). No paclitaxel dose reduction due to hyperglycemia was reported. Paclitaxel dose interruption due to hyperglycemia was reported in 2 patients (1.4%) in the Ipat+Pac arm (t_aesi_ctc_DSRPAC_B_SE, t_aesi_ctc_DSIPAC_B_SE).

Overall, the majority of hyperglycemia events had resolved (Ipat+Pac: 85.3% vs. Pbo+Pac: 97.4%) (t_aesiout_B_SE).

Narratives for patients who experienced Grade ≥3 hyperglycemia events are appended.

Cohort C

The number of patients with selected AEs in the category of hyperglycemia was 24 patients (23.5%). In the safety evaluable population, the PTs reported within this category were hyperglycemia (21.6%), blood glucose increased (2.0%), diabetes mellitus (1.0%), diabetic ketoacidosis (1.0%), type 1 diabetes mellitus (1.0%), glycosylated hemoglobin increased (1.0%) (t_aesi_C_SE).

The majority of cases of hyperglycemia were Grade 1 and 2. Grade 3 and 4 hyperglycemia events were reported in 3.9% and 1.0% of patients, respectively. No event of Grade 5 intensity was reported (t_aesi_ctc_C_SE).

One patient (1.0%) experienced a serious hyperglycemia event (Grade 4, PT: diabetic ketoacidosis) (t_aesi_SER_C_SE, t_aesi_ctc_SER_C_SE).

One patient (1.0%) discontinued from ipatasertib treatment due to hyperglycemia (t_aesi_ctc_DSCIPAT_C_SE). No patients discontinued paclitaxel or atezolizumab due to hyperglycemia (t_aesi_ctc_DSCPAC_C_SE, t_aesi_ctc_DSCATZ_C_SE).

Hyperglycemia led to ipatasertib dose reduction and dose interruption in 5 patients (4.9%) and 6 patients (5.9%), respectively (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSIIPAT_C_SE). No paclitaxel dose reduction due to hyperglycemia was reported. Paclitaxel dose interruption due to hyperglycemia was reported in 2 patients (2.0%) (t_aesi_ctc_DSRPAC_C_SE, t_aesi_ctc_DSIPAC_C_SE). Atezolizumab dose interruption due to hyperglycemia was reported in 3 patients (2.9%) (t_aesi_ctc_DSIATZ_C_SE).

Overall, the majority of hyperglycemia events had resolved (83.3%) (t_aesiout_C_SE).

Narratives for patients who experienced Grade ≥3 hyperglycemia events are appended.

5.2.2.6.4 Nausea

Cohort A

The proportion of patients with selected AEs in the nausea category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (66 patients [39.8%] vs. 22 patients [25.3%]) (t_aesi_A_SE).

Two events of nausea (both Grade 3) were reported as serious in the Ipat+Pac arm. Most nausea events were non-serious (t_aesi_ctc_SER_A_SE), and were Grade 1 or Grade 2, with Grade 3 events reported in 5 patients (3%) in the Ipat+Pac arm (t_aesi_ctc_A_SE). No events of Grade 4 or Grade 5 intensity were reported in either treatment arm. No patients were discontinued from any treatment in either treatment arm

(t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose interruption and reduction due to nausea was reported in 4 patients (2.4%) and 3 patients (1.8%), respectively (t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSRIPAT_A_SE). Paclitaxel dose interruption due to nausea was reported in 8 patients (4.8%) in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_A_SE). No paclitaxel dose reduction due to nausea was reported (t_aesi_ctc_DSRPAC_A_SE).

Overall, the majority of nausea events in both treatment arms had resolved (Ipat+Pac: 89.8% vs. Pbo+Pac: 93.1%) (t_aesiout_A_SE).

Cohort B

The proportion of patients with selected AEs in the nausea category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (60 patients [41.4%] vs. 17 patients [22.7%]) (t_aesi_B_SE).

No events of nausea were reported as serious (t_aesi_SER_B_SE). Most nausea events were Grade 1 or Grade 2, with Grade 3 events reported in 2 patients (1.4%) in the Ipat+Pac arm (t_aesi_ctc_B_SE). No events of Grade 4 or Grade 5 intensity were reported in either treatment arm. No patients were discontinued from ipatasertib or placebo due to nausea in either treatment arm (t_aesi_ctc_DSCIPAT_B_SE). Paclitaxel discontinuation due to nausea was reported in 0.7% of patients in the Ipat+Pac arm (t_aesi_ctc_DSCPAC_B_SE). In the Ipat+Pac arm, nausea led to ipatasertib dose reduction and dose interruption in 2 patients (1.4%) and in 3 patients (2.1%), respectively. Nausea led to paclitaxel dose reduction in 1 patient (0.7%) and dose interruption in 2 patients (1.4%) in the Ipat+Pac arm (t_aesi_ctc_DSRPAC_B_SE, t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSIPAC_B_SE).

Overall, the majority of nausea events in both treatment arms had resolved (Ipat+Pac: 89.4% vs. Pbo+Pac: 85.7%) (t_aesiout_B_SE).

Cohort C

The number of patients with selected AEs in the nausea category was 42 patients (41.2%) (t_aesi_C_SE).

One event of nausea (Grade 3) was reported as serious (t_aesi_SER_C_SE). Most nausea events were Grade 1 or Grade 2, with Grade 3 events reported in 2 patients (2%) (t_aesi_ctc_C_SE). No events of Grade 4 or Grade 5 intensity were reported. No patients were discontinued from any treatment (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCPAC_C_SE, t_aesi_ctc_DSCATZ_C_SE). Ipatasertib dose reduction and interruption due to nausea were reported in 4 patients (3.9%) and 5 patients (4.9%), respectively. Atezolizumab dose interruption due to nausea was reported in 3 patients (2.9%). No paclitaxel dose reduction was reported, but paclitaxel dose interruption due to nausea was reported in 4 patients (3.9%) (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIATZ_C_SE, t_aesi_ctc_DSRPAC_C_SE, t_aesi_ctc_DSIPAC_C_SE).

Overall, the majority of nausea events had resolved (80.3%) (t_aesiout_C_SE).

5.2.2.6.5 Vomiting

Cohort A

The proportion of patients with selected AEs in the vomiting category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (54 patients [32.5%] vs. 8 patients [9.2%]) (t_aesi_A_SE).

The majority of the reported events of vomiting were Grade 1 or Grade 2. Grade 3 and Grade 4 events were reported in 4 patients (2.4%) and 1 patient (1.1%), respectively, in the Ipat + Pac arm and Pbo+Pac arm (t_aesi_ctc_A_SE).

Two events of vomiting (Grade 3 or 4) were reported as serious in the Ipat+Pac arm (t_aesi_SER_A_SE, t_aesi_ctc_SER_A_SE). No patients in the Ipat + Pac or Pbo + Pac arm discontinued any drug due to vomiting (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). In the Ipat+Pac arm, vomiting led to ipatasertib and paclitaxel dose interruption in 3 patients each (1.8%) (t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSIPAC_A_SE). No patients had treatment dose reduction due to vomiting in either treatment arms (t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSRPAC_A_SE).

Overall, the majority of vomiting events had resolved (Ipat+Pac: 97.6% vs. Pbo+Pac: 100%) (t_aesiout_A_SE).

Cohort B

The proportion of patients with selected AEs in the vomiting category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (45 patients [31.0%] vs. 6 patients [8.0%]) (t_aesi_B_SE).

The majority of reported events of vomiting were Grade 1 or Grade 2. Grade 3–4 events were reported in 3 patients (2.1%) in the Ipat + Pac arm and were not reported in the Pbo+Pac arm (t_aesi_ctc_B_SE). No Grade 5 event of vomiting was reported.

No serious events of vomiting were reported (t_aesi_SER_B_SE). One patient in the Ipat + Pac arm discontinued ipatasertib due to vomiting. No patients were discontinued from paclitaxel due to vomiting (t_aesi_ctc_DSCIPAT_B_SE, t_aesi_ctc_DSCPAC_B_SE). In the Ipat+Pac arm, vomiting led to ipatasertib dose interruption in 7 patients (4.8%); and paclitaxel dose interruption in 4 patients (2.8%) (t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSIPAC_B_SE). Ipatasertib dose reduction was reported in one patient (0.7%) in the Ipat+Pac arm (t_aesi_ctc_DSRIPAT_B_SE). Paclitaxel dose interruption due to vomiting was reported in 4 patients (2.8%) in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_B_SE). No paclitaxel dose reduction due to vomiting was reported in either treatment arm (t_aesi_ctc_DSRPAC_B_SE).

Overall, the majority of vomiting events had resolved (Ipat+Pac: 97.0% vs. Pbo+Pac: 100%) (t_aesiout_B_SE).

Cohort C

The number of patients with selected AEs in the vomiting category was 29 patients (28.4%) (t_aesi_C_SE).

The majority of reported events of vomiting were Grade 1 or Grade 2. Grade 3 events were reported in 2 patients (2.0%) (t_aesi_ctc_C_SE). No Grade 4 or 5 event of vomiting was reported.

Two serious events of vomiting (Grade 1 and Grade 3) were reported (t_aesi_SER_C_SE, t_aesi_ctc_SER_C_SE). No patients were discontinued from any study drug due to vomiting (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCPAC_C_SE, t_aesi_ctc_DSCATZ_C_SE). Vomiting led to ipatasertib dose interruption in 2 patients (2.0%) and paclitaxel dose interruption in 1 patient (1.0%). No atezolizumab dose interruption due to vomiting were reported (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE, t_aesi_ctc_DSIATZ_C_SE). Ipatasertib dose reduction was reported in 1 patient (1.0%) (t_aesi_ctc_DSRIPAT_C_SE). No paclitaxel dose reduction due to vomiting was reported (t_aesi_ctc_DSRPAC_C_SE).

All of the vomiting events resolved (t_aesiout_C_SE).

5.2.2.6.6 Asthenia

Cohort A

The proportions of patients with selected AEs in the asthenia category was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (63 patients [38.0%] vs. 25 patients [28.7%]) (t_aesi_A_SE).

The majority of asthenia events were Grade 1 or Grade 2. Grade 3 asthenia events were reported in 7.2% of patients in the Ipat+Pac arm and 3.4% of patients in the Pbo+Pac arm. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_A_SE).

One Grade 3 asthenia event (PT: fatigue) was reported as serious in the Ipat+Pac arm and the event had resolved (t_aesi_SER_A_SE). Ipatasertib treatment discontinuation due to asthenia was reported in 1 patient (0.6%) in the Ipat+Pac arm(t_aesi_ctc_DSCIPAT_A_SE). Paclitaxel treatment discontinuation due to asthenia was reported in 1 patient (1.1%) in the Pbo+Pac arm and none in the Ipat+Pac arm (t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose reduction due to asthenia was reported in 1 (0.6%) patient in the Ipat+Pac arm only (t_aesi_ctc_DSRIPAT_A_SE). Ipatasertib/placebo dose interruption due to asthenia was reported in 3 patients (1.8%) and 1 patient (1.1%) in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIIPAT_A_SE). Paclitaxel dose reduction due to asthenia was reported in 2 (1.2%) and 1 (1.1%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSRPAC_A_SE). Paclitaxel dose interruption due to asthenia was reported in 6 (3.6%) and 2 (2.3%) of patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_A_SE)

Overall, 52.7% and 50% of AEs of asthenia resolved in the Ipat+Pac and Pbo+Pac arms, respectively (t_aesiout_A_SE).

Cohort B

The proportions of patients with selected AEs in the asthenia category was lower in the Ipat+Pac arm compared with the Pbo+Pac arm (55 patients [37.9%] vs. 31 patients [41.3%]) (t_aesi_B_SE).

The majority of asthenia events were Grade 1 or Grade 2. Grade 3 asthenia events were reported in 1.4% of patients in the Ipat+Pac arm and 5.3% of patients in the Pbo+Pac arm. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_B_SE).

One Grade 3 asthenia event (PT: fatigue) was reported as serious in the Pbo+Pac arm and the event had resolved (t_aesi_SER_B_SE, t_aesi_ctc_SER_B_SE). Ipatasertib treatment discontinuation due to asthenia was reported in none of the patients in the Ipat+Pac arm (t_aesi_ctc_DSCIPAT_B_SE). Paclitaxel treatment discontinuation due to asthenia was reported in 1 patient each in the Pbo+Pac arm (1.3%) and in the Ipat+Pac arm (0.7%) (t_aesi_ctc_DSCPAC_B_SE). Ipatasertib dose reduction due to asthenia was reported in none of the patients in the Ipat+Pac arm (t_aesi_ctc_DSRIPAT_B_SE). Ipataserti dose interruption due to asthenia was reported in 3 patients each in the Ipat+Pac arm (2.1%) (t_aesi_ctc_DSIIPAT_B_SE). Paclitaxel dose reduction due to asthenia was reported in 2 patients (2.7%) in the Pbo+Pac arm and none in the Ipat+Pac arm (t_aesi_ctc_DSRPAC_B_SE). Paclitaxel dose interruption due to asthenia was reported in 5 patients (3.4%) in the Ipat+Pac arm and 4 patients (5.3%) in the Pbo+Pac arm (t_aesi_ctc_DSIPAC_B_SE)

Overall, 63.9% and 64.6% of AEs of asthenia resolved in the Ipat+Pac and Pbo+Pac arms, respectively (t_aesiout_B_SE).

Cohort C

The number of patients with selected AEs in the asthenia category was 40 patients (39.2%) (t_aesi_C_SE).

The majority of asthenia events were Grade 1 or Grade 2. Grade 3 asthenia events were reported in 3.9% of patients. No events of Grade 4 or Grade 5 intensity were reported (t_aesi_ctc_C_SE).

One Grade 2 and one Grade 3 asthenia events (PT: fatigue) were reported as serious and both events had resolved (t_aesi_SER_C_SE, t_aesi_ctc_SER_C_SE). No ipatasertib or atezolizumab treatment discontinuation due to asthenia was reported (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE). Paclitaxel treatment discontinuation due to asthenia was reported in 1 patient (1.0%) (t_aesi_ctc_DSCPAC_C_SE). No ipatasertib or paclitaxel dose reduction due to asthenia was reported (t_aesi_ctc_DSRIPAT_C_SE,

t_aesi_ctc_DSRPAC_C_SE). Ipatasertib and paclitaxel dose interruption due to asthenia were reported in 2 (2.0%) and 6 (5.9%) patients, respectively (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE). Atezolizumab dose interruption due to asthenia was reported in 3 patients (2.9%) (t_aesi_ctc_DSIATZ_C_SE).

Overall, 57.6% of AEs of asthenia resolved (t_aesiout_C_SE).

5.2.2.6.7 Oral Mucositis

Cohort A

The proportion of patients with selected AEs in the category of oral mucositis was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (30 patients [18.1%] vs. 8 patients [9.2%]). The most commonly reported PT within this category was stomatitis (10.8% vs. 6.9%) (t_aesi_A_SE). All oral mucositis events were Grade 1 or Grade 2 except for one Grade 3 event in Ipat+Pac arm (t_aesi_ctc_A_SE).

There were no serious oral mucositis events reported (t_aesi_SER_A_SE). No patients were discontinued from any study treatment in either treatment arm (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose interruption and reduction due to oral mucositis was reported in 2 patients (1.2%) and 1 patient (0.6%), respectively (t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSRIPAT_A_SE). Paclitaxel dose interruption due to oral mucositis was reported in 2 patients (1.2%) in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_A_SE). No paclitaxel dose reduction due to oral mucositis was reported in either treatment arm (t_aesi_ctc_DSRPAC_A_SE).

Overall, the majority of the oral mucositis events in both the treatment arms had resolved (Ipat+Pac: 93.3% vs. Pbo+Pac: 100%) (t_aesiout_A_SE).

Cohort B

The proportion of patients with selected AEs in the category of oral mucositis was higher in the Ipat+Pac arm as compared with the Pbo+Pac arm (27 patients [18.6%] vs. 9 patients [12.0%]). The most commonly reported PT within this category was stomatitis (11.0% vs. 8.0%) (t_aesi_B_SE). All oral mucositis events were Grade 1 or Grade 2 (t_aesi_ctc_B_SE).

There were no serious oral mucositis events reported (t_aesi_SER_B_SE). One patient (0.7%) was discontinued from ipatasertib treatment in the Ipat+Pac arm due to oral mucositis (t_aesi_ctc_DSCIPAT_B_SE). No patients were discontinued from paclitaxel treatment in either treatment arm due to oral mucositis (t_aesi_ctc_DSCPAC_B_SE). No ipatasertib or paclitaxel dose reduction due to oral mucositis was reported (t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSRPAC_B_SE). Ipatasertib dose interruption due to oral mucositis was reported in 2 patients (1.4%) in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_B_SE). Paclitaxel dose interruption due to oral mucositis was reported in 1 patient (1.3%) in the Pbo+Pac arm only (t_aesi_ctc_DSIPAC_B_SE).

Overall, the majority of oral mucositis events in both treatment arms had resolved (Ipat+Pac: 93.2% vs. Pbo+Pac: 92.3%) (t_aesiout_B_SE).

Cohort C

The proportion of patients with selected AEs in the category of oral mucositis was 20.6%. The most commonly reported PT within this category was mucosal inflammation (11.8%) (t_aesi_C_SE). All oral mucositis events were Grade 1 or Grade 2 (t_aesi_ctc_C_SE).

There were no serious oral mucositis events reported (t_aesi_SER_C_SE). No patients were discontinued from any study treatment (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE, t_aesi_ctc_DSCPAC_C_SE). No ipatasertib or atezolizumab dose interruptions were reported due to oral mucositis (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIATZ_C_SE). Paclitaxel dose interruption due to oral mucositis was reported in 1 patient (1.0%) (t_aesi_ctc_DSIPAC_C_SE). No ipatasertib or paclitaxel dose reduction was reported due to oral mucositis (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSRPAC_C_SE).

Overall, the majority of oral mucositis events had resolved (91.3%) (t_aesiout_C_SE).

5.2.2.6.8 Erythema Multiforme

Cohort A

Selected AEs in the category of erythema multiforme was reported in 1 patient (0.6%) in the Ipat+Pac arm (PT: erythema multiforme) (t_aesi_A_SE). The event was reported as serious Grade 3, led to discontinuation of ipatasertib treatment and had resolved (t_aesi_ctc_SER_A_SE, t_aesiout_A_SE, l_aesi_A_SE).

Cohort B

Selected AEs in the category of erythema multiforme was reported in 1 patient (0.7%) in the Ipat+Pac arm (PT: erythema multiforme) (t_aesi_B_SE). The event was reported as serious Grade 3, led to dose reduction of ipatasertib treatment and had resolved (l_aesi_B_SE).

Cohort C

No selected AEs in the category of erythema multiforme were reported in Cohort C (t_aesi_C_SE, l_aesi_C_SE).

5.2.2.6.9 Neutropenia

Cohort A

The proportion of patients with selected AEs in the category of neutropenia was higher in Pbo+Pac arm than Ipat+Pac arm (Ipat+Pac: 51 patients [30.7%] vs. Pbo+Pac: 31 patients [35.6%]) (t_aesi_A_SE).

The majority of neutropenia events were Grade 1 or 2. Grade 3 neutropenia events were reported in 18 (10.8%) and 8 (9.2%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively. Grade 4 neutropenia events were reported in 5 (3.0%) and 1 (1.1%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_A_SE). A total of

4 (2.4%) patients in the Ipat+Pac arm (2 each of Grade 3 and Grade 4) and 1 (1.1%) patient in the Pbo+Pac arm (Grade 4) experienced serious neutropenia events that had resolved (t_aesi_SER_A_SE). No Grade 5 neutropenia event was reported.

One patient (0.6%) in the Ipat+Pac arm discontinued ipatersertib treatment due to neutropenia (t_aesi_ctc_DSCIPAT_A_SE). Two patients (1.2%) in the Ipat+Pac arm discontinued paclitaxel treatment due to neutropenia (t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose interruption due to neutropenia was reported in 15 (9.0%) patients in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_A_SE). Ipatasertib dose reduction due to neutropenia was reported in 9 (5.4%) patients in the Ipat+Pac arm (t_aesi_ctc_DSRIPAT_A_SE). Paclitaxel dose interruption due to neutropenia was reported in 34 (20.5%) and 21 (24.1%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_A_SE). Paclitaxel dose reduction due to neutropenia was reported in 10 (6.0%) and 2 (2.3%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSRPAC_A_SE).

Overall, the majority of neutropenia events had resolved (Ipat+Pac: 95.9% vs. Pbo+Pac: 98.4%) (t_aesiout_A_SE).

See Hematology for laboratory assessment of neutrophil counts.

Cohort B

The proportions of patients with selected AEs in the category of neutropenia were similar between treatment arms (Ipat+Pac: 59 patients [40.7%] vs. Pbo+Pac: 33 patients [44.0%]) (t_aesi_B_SE).

The majority of neutropenia events were Grade 1 or 2. Grade 3 neutropenia events were reported in 21 (14.5%) and 10 (13.3%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively. Grade 4 neutropenia events were reported in 4 (2.8%) and 2 (2.7%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively. One Grade 5 neutropenia event (PT: febrile neutropenia) considered related to ipatasertib and paclitaxel was reported (t_aesi_ctc_B_SE, l_aesi_B_SE). A total of 3 (2.1%) patients in the Ipat+Pac arm experienced serious neutropenia events (Grade 3: 2 patients [1.4%]; Grade 5: 1 patient [0.7%]) (t_aesi_ctc_SER_B_SE).

Three patients (2.1%) in the Ipat+Pac arm discontinued ipatasertib treatment due to neutropenia (t_aesi_ctc_DSCIPAT_B_SE). Eight patients (5.5%) in the Ipat+Pac arm and 2 patients (2.7%) in the Pbo+Pac arm discontinued paclitaxel treatment due to neutropenia (t_aesi_ctc_DSCPAC_B_SE). Ipatasertib dose interruption due to neutropenia was reported in 18 (12.4%) patients in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_B_SE). Ipatasertib dose reduction due to neutropenia was reported in 9 (6.2%) patients in the Ipat+Pac arm (t_aesi_ctc_DSRIPAT_B_SE). Paclitaxel dose interruption due to neutropenia was reported in 35 (24.1%) and 22 (29.3%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_B_SE). Paclitaxel dose reduction due to neutropenia was reported in

13 (9.0%) and 6 (8.0%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSRPAC_B_SE).

Overall, the majority of neutropenia events had resolved (Ipat+Pac: 98.5% vs. Pbo+Pac: 96.7%) (t_aesiout_B_SE).

See Hematology for laboratory assessment of neutrophil counts.

Cohort C

The number of patients with selected AEs in the category of neutropenia was 34 patients (33.3%) (t_aesi_C_SE).

The majority of neutropenia events were Grade 1 or 2. Grade 3 neutropenia events were reported in 8 (7.8%) patients. Grade 4 neutropenia events were reported in 3 (2.9%) patients. No Grade 5 neutropenia event was reported (t_aesi_ctc_C_SE). A total of 2 (2.0%) patients experienced serious neutropenia events (PT: febrile neutropenia) of Grade 3 and Grade 4, both of which had resolved (t_aesi_SER_C_SE, l_aesi_C_SE).

No ipatasertib or atezolizumab treatment discontinuation due to neutropenia was reported (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE). One patient (1.0%) in the Ipat+Pac arm discontinued paclitaxel treatment due to neutropenia (t_aesi_ctc_DSCPAC_C_SE). Ipatasertib, paclitaxel, and atezolizumab dose interruption due to neutropenia was reported in 14 (13.7%), 22 (21.6%), and 10 (9.8%) patients, respectively (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE, t_aesi_ctc_DSIATZ_C_SE). Ipatasertib and paclitaxel dose reduction due to neutropenia was reported in 6 (5.9%) and 6 (5.9%) patients, respectively (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSRPAC_C_SE).

The majority of neutropenia events had resolved (99.4%) (t_aesiout_C_SE).

See Hematology for laboratory assessment of neutrophil counts.

5.2.2.6.10 Erythropenia

Cohort A

The proportion of patients with selected AEs in the erythropenia category was similar between the Ipat+Pac arm and the Pbo+Pac arm (45 patients [27.1%] vs. 23 patients [26.4%]). The most commonly reported PT in this selected AE was anemia (26.5% vs. 26.4%) (t_aesi_A_SE).

Most erythropenia events were Grade 1 or Grade 2. Grade 3 erythropenia (PT: anemia) was reported in 4 patients (2.4%) in the Ipat+Pac arm and 2 patients (2.3%) in the Pbo+Pac arm. Only 1 Grade 4 erythropenia (PT: anemia) was reported in 1 patient (1.1%) in the Pbo+Pac arm. No events of Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_A_SE).

One Grade 3 erythropenia event (PT: anemia) in the Ipat+Pac arm was reported as serious and it resolved (t_aesi_SER_A_SE). One Grade 4 erythropenia event (PT: anemia) in the Pbo+Pac arm was reported as serious and it resolved (t_aesi_SER_A_SE).

No patient was discontinued from any treatment in either treatment arm (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). No ipatasertib dose reduction due to erythropenia was reported (t_aesi_ctc_DSRIPAT_A_SE). Ipatasertib dose interruption due to erythropenia was reported in 3 (1.8%) patients in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_A_SE). Paclitaxel dose interruption due to erythropenia was reported in 7 (4.2%) and 1 (1.1%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_A_SE). Paclitaxel dose reduction due to erythropenia was reported in 1 patient (0.6%) in the Ipat+Pac arm only (t_aesi_ctc_DSRPAC_A_SE).

Overall, the majority of erythropenia events had resolved (Ipat+Pac: 59.7% vs. Pbo+Pac: 66.7%) (t_aesiout_A_SE).

See Hematology for laboratory assessment of red blood cell count, hematocrit and hemoglobin.

Cohort B

The proportion of patients with selected AEs in the erythropenia category was higher in the Ipat+Pac arm than the Pbo+Pac arm (47 patients [32.4%] vs. 16 patients [21.3%]). The most commonly reported PT in this selected AE was anemia (31.0% vs. 20.0%) (t_aesi_B_SE).

No events of erythropenia were reported as serious (t_aesi_SER_B_SE). Most erythropenia events were Grade 1 or Grade 2. Grade 3 erythropenia (PT: anemia) was reported in 2 patients (1.4%) in the Ipat+Pac arm. No events of Grade 4 or 5 intensity were reported in either treatment arm (t_aesi_ctc_B_SE).

No patient was discontinued from ipatasertib treatment in either treatment arm (t_aesi_ctc_DSCIPAT_B_SE). One patient (0.7%) was discontinued from paclitaxel treatment in the Ipat+Pac arm (t_aesi_ctc_DSCPAC_B_SE). Ipatasertib and paclitaxel dose interruption due to erythropenia was reported in 1 patient (0.7%) each in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSIPAC_B_SE). No ipatasertib dose reduction due to erythropenia was reported (t_aesi_ctc_DSRIPAT_B_SE). Paclitaxel dose reduction due to erythropenia was reported in 1 patient (0.7%) in the Ipat+Pac arm (t_aesi_ctc_DSRPAC_B_SE).

Overall, the majority of the erythropenia events had resolved (Ipat+Pac: 77.4% vs. Pbo+Pac: 83.9%) (t_aesiout_B_SE).

See Hematology for laboratory assessment of red blood cell count, hematocrit and hemoglobin.

Cohort C

The number of patients with selected AEs in the erythropenia category was 34 patients (33.3%). The most commonly reported PT in this selected AE was anemia (33.3%) (t_aesi_C_SE).

No events of erythropenia were reported as serious (t_aesi_SER_C_SE). Most erythropenia events were Grade 1 or Grade 2. Grade 3 erythropenia (PT: anemia) was reported in 2 patients (2.0%). No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_C_SE).

No patient was discontinued from any treatment (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCPAC_C_SE, t_aesi_ctc_DSCATZ_C_SE). No ipatasertib dose reduction due to erythropenia was reported (t_aesi_ctc_DSRIPAT_C_SE). Paclitaxel dose reduction due to erythropenia was reported in 1 patient (1.0%) (t_aesi_ctc_DSRPAC_C_SE). No ipatasertib or atezolizumab dose interruption due to erythropenia was reported (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIATZ_C_SE). Paclitaxel dose interruption due to erythropenia was reported in 2 patients (2.0%) (t_aesi_ctc_DSIPAC_C_SE).

The majority of erythropenia events had resolved (67.9%) (t_aesiout_C_SE).

See Hematology for laboratory assessment of red blood cell count, hematocrit and hemoglobin.

5.2.2.6.11 Hepatotoxicity

Cohort A

Selected AEs in the category of hepatotoxicity were reported in 29 patients (17.5%) in the Ipat+Pac arm and 12 patients (13.8%) in the Pbo+Pac arm. The most commonly reported PTs in this category were alanine aminotransferase increased (13.9% vs. 8.0%), aspartate aminotransferase increased (10.8% vs. 6.9%) and blood alkaline phosphatase increased (5.4% vs. 1.1%) (t_aesi_A_SE).

The majority of hepatotoxicity events were Grade 1 or 2. Grade 3 hepatotoxicity were reported in 4.8% of patients the Ipat+Pac arm and 3.4% of patients in the Pbo+Pac arm. Grade 4 hepatoxicity was reported in one patient in the Ipat+Pac arm and no patient in the Pbo+Pac arm. No Grade 5 hepatotoxicity events were reported (t_aesi_ctc_A_SE).

No hepatotoxicity events were reported as serious (t_aesi_SER_A_SE). One patient (0.6%) in the Ipat+Pac arm discontinued ipatasertib treatment due to Grade 3 hepatotoxicity (PT: alanine aminotransferase increased and aspartate aminotransferase increased) (t_aesi_ctc_DSCIPAT_A_SE, l_aesi_A_SE). No patients discontinued paclitaxel treatment due to hepatotoxicity (t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose reduction due to hepatotoxicity was reported in 5 (3.0%) in the Ipat+Pac arm (t_aesi_ctc_DSRIPAT_A_SE). Ipatasertib dose interruption due to hepatotoxicity was reported in 1 patient (0.6%) in Ipat+Pac arm (t_aesi_ctc_DSIIPAT_A_SE). Paclitaxel dose reduction due to hepatotoxicity was reported in

3 (1.8%) patients in the Ipat+Pac arm only (t_aesi_ctc_DSRPAC_A_SE). Paclitaxel dose interruption due to hepatotoxicity was reported in 2 (1.2%) and 4 (4.6%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_A_SE).

The majority of hepatotoxicity events had resolved (Ipat+Pac: 74.3% vs Pbo+Pac: 91.9%) (t_aesiout_A_SE).

Narratives for patients who experienced Grade ≥3 hepatotoxicity events are appended.

Cohort B

Selected AEs in the category of hepatotoxicity were reported in 25 patients (17.2%) in the Ipat+Pac arm and 21 patients (28.0%) in the Pbo+Pac arm. The most commonly reported PTs in this category were alanine aminotransferase increased (13.1% vs. 20.0%), aspartate aminotransferase increased (9.0% vs. 13.3%), and hyperbilirubinaemia (4.1% vs. 5.3%) (t_aesi_B_SE).

The majority of hepatotoxicity events were Grade 1 or 2. Grade 3 hepatotoxicity were reported in 5.5% of patients the Ipat+Pac arm and 4.0% of patients in the Pbo+Pac arm. No Grade 4 or 5 hepatotoxicity events were reported (t_aesi_ctc_B_SE).

No hepatotoxicity events were reported as serious (t_aesi_SER_B_SE). One patient (0.7%) in the Ipat+Pac arm discontinued ipatasertib treatment due to Grade 3 hepatotoxicity (PT: alanine aminotransferase increased) (t_aesi_ctc_DSCIPAT_B_SE, l_aesi_B_SE). No patients discontinued paclitaxel treatment due to hepatotoxicity (t_aesi_ctc_DSCPAC_B_SE). Ipatasertib dose reduction due to hepatotoxicity was reported in 2 (1.4%) patients in the Ipat+Pac arm only (t_aesi_ctc_DSRIPAT_B_SE). Ipatasertib dose interruption due to hepatotoxicity was reported in 5 (3.4%) patients in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_B_SE). Paclitaxel dose reduction due to hepatoxicity was reported in 1 (1.3%) patient in the Pbo+Pac arm only (t_aesi_ctc_DSRPAC_B_SE). Paclitaxel dose interruption due to hepatotoxicity was reported in 8 (5.5%) and 4 (5.3%) patients in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSIPAC_B_SE).

The majority of hepatotoxicity events had resolved (Ipat+Pac: 82.9% vs Pbo+Pac: 88.7%) (t_aesiout_B_SE).

Narratives for patients who experienced Grade ≥3 hepatotoxicity events are appended.

Cohort C

Selected AEs in the category of hepatotoxicity were reported in 35 patients (34.3%). The most commonly reported PTs in this category were alanine aminotransferase increased (25.5%), aspartate aminotransferase increased (21.6%), and hyperbilirubinaemia (5.9%) (t_aesi_C_SE).

The majority of hepatotoxicity events were Grade 1 or 2. Grade 3 hepatotoxicity were reported in 13.7% of patients. No Grade 4 or 5 hepatotoxicity events were reported (t_aesi_ctc_C_SE).

Two Grade 3 hepatotoxicity events were reported as serious and had resolved (PT: alanine aminotransferase increased and aspartate aminotransferase increased) (t_aesi_SER_C_SE, l_aesi_C_SE). Ipatasertib, atezolizumab, and paclitaxel discontinuation due to hepatotoxicity was reported in 3 (2.9%), 3 (2.9%), and 1 (1.0%) patients, respectively (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE, t_aesi_ctc_DSCPAC_C_SE). Ipatasertib and paclitaxel dose reduction due to hepatotoxicity was reported in 1 (1.0%) and 2 (2.0%) patients, respectively (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSRPAC_C_SE). Ipatasertib, atezolizumab, and paclitaxel dose interruption due to hepatotoxicity was reported in 7 (6.9%), 8 (7.8%), and 8 (7.8%) patients, respectively (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIATZ_C_SE, t_aesi_ctc_DSIPAC_C_SE).

The majority of hepatotoxicity events had resolved (85.9%) (t_aesiout_C_SE).

Narratives for patients who experienced Grade ≥3 hepatotoxicity events are appended.

5.2.2.6.12 Hyperlipidemia

Cohort A

The proportions of patients with selected AEs in the hyperlipidemia category were similar between treatment arms (Ipat+Pac: 13 patients [7.8%] vs. Pbo+Pac: 5 patients [5.7%]) (t_aesi_A_SE).

The majority of hyperlipidemia events were Grade 1 or 2 (t_aesi_ctc_A_SE). One patient (0.6%) in the Ipat+Pac arm had Grade 3 hyperlipidemia (PT: hypertriglyceridemia) that had not resolved (l_aesi_A_SE). No Grade 4 or 5 hyperlipidemia event was reported.

No events of hyperlipidemia were reported as serious (t_aesi_SER_A_SE). No patients had discontinuation of any study treatment due to hyperlipidemia (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). No ipatasertib or paclitaxel dose reduction due to hyperlipidemia was reported (t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSRPAC_A_SE). Ipatasertib dose interruption due to hyperlipidemia was reported in 2 (1.2%) patients in the Ipat+Pac arm only (t_aesi_ctc_DSIIPAT_A_SE). Paclitaxel dose interruption due to hyperlipidemia was reported in 1 (0.6%) patient in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_A_SE).

Overall, 36.4% and 40% of hyperlipidemia events in the Ipat+Pac arm and Pbo+Pac arm, respectively, had resolved (t_aesiout_A_SE).

Cohort B

The proportions of patients with selected AEs in the hyperlipidemia category were similar between treatment arms (Ipat+Pac: 17 patients [11.7%] vs. Pbo+Pac: 8 patients [10.7%]) (t_aesi_B_SE).

The majority of hyperlipidemia events were Grade 1 or 2 (t_aesi_ctc_B_SE). One patient (0.7%) in the Ipat+Pac arm had Grade 3 hyperlipidemia (PT: hypertriglyceridemia) and 1 patient (1.3%) in the Pbo+Pac arm had Grade 4 hyperlipidemia (PT: hypertriglyceridemia) that had both resolved (l_aesi_B_SE). No Grade 5 hyperlipidemia was reported.

No events of hyperlipidemia were reported as serious (t_aesi_SER_B_SE). No patients had discontinuation of any study treatment due to hyperlipidemia (t_aesi_ctc_DSCIPAT_B_SE, t_aesi_ctc_DSCPAC_B_SE). No ipatasertib dose interruption due to hyperlipidemia was reported (t_aesi_ctc_DSIIPAT_B_SE). Paclitaxel dose interruption due to hyperlipidemia was reported in 1 patient (1.3%) in the Pbo+Pac arm (t_aesi_ctc_DSIPAC_B_SE). No ipatasertib or paclitaxel dose reduction due to hyperlipidemia was reported (t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSRPAC_B_SE).

Overall, the majority of the hyperlipidemia events had resolved (Ipat+Pac: 64.5% vs. Pbo+Pac: 76.9%) (t_aesiout_B_SE).

Cohort C

The selected AEs in the hyperlipidemia category were reported in 14 patients (13.7%) (t_aesi_C_SE).

The majority of hyperlipidemia events were Grade 1 or 2 (t_aesi_ctc_C_SE). One patient (1.0%) had a Grade 3 hyperlipidemia event (PT: blood cholesterol increased) and the same patient had a Grade 4 hyperlipidemia (PT: blood triglycerides increased) event, both of which had not resolved (l_aesi_C_SE). No Grade 5 hyperlipidemia event was reported (t_aesi_ctc_C_SE).

No events of hyperlipidemia were reported as serious (t_aesi_SER_C_SE). No patients had discontinuation of any study treatment due to hyperlipidemia (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCPAC_C_SE, t_aesi_ctc_DSCATZ_C_SE). No ipatasertib, atezolizumab, or paclitaxel dose interruption due to hyperlipidemia was reported (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIATZ_C_SE, t_aesi_ctc_DSIPAC_C_SE). Ipatasertib dose reduction due to hyperlipidemia was reported in 1 patient (1.0%) (t_aesi_ctc_DSRIPAT_C_SE). No paclitaxel dose reduction due to hyperlipidemia was reported (t_aesi_ctc_DSRPAC_C_SE).

Half of the hyperlipidemia events had resolved (50%) (t_aesiout_C_SE).

5.2.2.6.13 Pneumonitis

Cohort A

The proportions of patients with selected AEs in the pneumonitis category were similar between treatment arms (Ipat+Pac: 3 patients [1.8%] vs. Pbo+Pac: 1 patient [1.1%]) (t_aesi_A_SE). All the events were Grade 1 and non-serious (t_aesi_ctc_A_SE, t_aesi_SER_A_SE). No patients had discontinuation of any study treatment due to pneumonitis (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose interruption due to

pneumonitis was reported in 2 patients (1.2%) (t_aesi_ctc_DSIIPAT_A_SE). Paclitaxel dose interruption due to pneumonitis was reported in 1 patient (0.6%) in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_A_SE). No dose reduction due to pneumonitis was reported for any study treatment (t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSRPAC_A_SE).

Overall, the majority of pneumonitis events had resolved (Ipat+Pac: 66.7% vs. Pbo+Pac: 100%) (t_aesiout_A_SE).

Narratives for patients who experienced Grade ≥2 pneumonitis events are appended.

Cohort B

The proportion of patients with selected AEs in the pneumonitis category was higher in the Ipat+Pac arm (6 patients [4.1%]) than in the Pbo+Pac arm (0 patient) (t_aesi_B_SE).

The majority of pneumonitis events were Grade 1 or 2. Two serious events of pneumonitis (Grade 2 and 3) were reported in the Ipat+Pac arm and had resolved (t_aesi_ctc_B_SE, l_aesi_B_SE).

Ipatasertib and paclitaxel discontinuation due to pneumonitis was reported in 1 patient (0.7%) each in the Ipat+Pac arm (t_aesi_ctc_DSCIPAT_B_SE, t_aesi_ctc_DSCPAC_B_SE). Ipatasertib dose interruption due to pneumonitis was reported in 1 patient (0.7%) (t_aesi_ctc_DSIIPAT_B_SE). Paclitaxel dose interruption due to pneumonitis was reported in 1 patient (0.7%) in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_B_SE). Ipatasertib dose reduction due to pneumonitis was reported in 1 patient (0.7%) (t_aesi_ctc_DSRIPAT_B_SE). Paclitaxel dose reduction due to pneumonitis was reported in 1 patient (0.7%) in the Ipat+Pac arm (t_aesi_ctc_DSRPAC_B_SE).

Overall, the majority of pneumonitis events in the Ipat+Pac arm had resolved (66.7%) (t_aesiout_B_SE).

Narratives for patients who experienced Grade ≥2 pneumonitis events are appended.

Cohort C

Selected AEs in the pneumonitis category were reported in 9 patients (8.8%) (t_aesi_C_SE).

The majority of pneumonitis events were Grade 1 or 2 (t_aesi_ctc_C_SE). Two serious Grade 2 pneumonitis events (PT: pneumonitis and immune-mediated lung disease) and one serious Grade 3 pneumonitis (PT: pneumonitis) were reported. All serious events of pneumonitis had resolved (t_aesi_SER_C_SE, t_aesi_ctc_SER_C_SE, l_aesi_C_SE).

Ipatasertib, atezolizumab, and paclitaxel treatment discontinuation due to pneumonitis was reported in 1 patient (1.0%) each (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE, t_aesi_ctc_DSCPAC_C_SE). Ipatasertib, paclitaxel, and atezolizumab dose interruption due to pneumonitis was reported in 4 patients (3.9%), 3 patients (2.9%), and 6 patients (5.9%),

respectively (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE, t_aesi_ctc_DSIATZ_C_SE). No dose reductions due to pneumonitis were reported for any study treatment (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSRPAC_C_SE).

Overall, the majority of pneumonitis events had resolved (66.7%) (t_aesiout_C_SE).

Narratives for patients who experienced Grade ≥2 pneumonitis events are appended.

5.2.2.6.14 Thrombocytopenia

Cohort A

Selected AEs in the category of thrombocytopenia were reported in 2 patients (1.2%) in the Ipat+Pac arm and 4 patients (4.6%) in the Pbo+Pac arm(t_aesi_A_SE).

One patient (1.1%) in the Pbo+Pac arm experienced Grade 3 thrombocytopenia (PT: thrombocytopenia) and the rest of the thrombocytopenia events were Grade 1–2 in intensity (t_aesi_ctc_A_SE). The Grade 3 thrombocytopenia was reported as serious that led to paclitaxel dose interruption and had not resolved (l_aesi_A_SE, t_aesi_ctc_DSIPAC_A_SE).

No thrombocytopenia events led to discontinuation of any study treatments in either treatment arm (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). No ipatasertib dose interruption or dose reduction of any study drug due to thrombocytopenia was reported (t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSRPAC_A_SE).

Overall, the proportion of the thrombocytopenia events that had resolved in the Ipat+Pac arm and Pbo+Pac arm were 100% and 20%, respectively.

Cohort B

Selected AEs in the category of thrombocytopenia were reported in 3 patients (2.1%) in the Ipat+Pac arm and 1 patient (1.3%) in the Pbo+Pac arm (t_aesi_B_SE).

One patient (0.7%) in the Ipat+Pac arm experienced Grade 3 thrombocytopenia (PT: thrombocytopenia) and the rest of the thrombocytopenia events were Grade 1 in intensity (t_aesi_ctc_B_SE). No thrombocytopenia events were reported as serious (t_aesi_SER_B_SE).

No thrombocytopenia events led to discontinuation of any study treatments in either treatment arm (t_aesi_ctc_DSCIPAT_B_SE, t_aesi_ctc_DSCPAC_B_SE). No ipatasertib dose interruption or reduction due to thrombocytopenia was reported (t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSRIPAT_B_SE). Paclitaxel dose interruptions due to thrombocytopenia were reported in 2 patients (1.4%) in the Ipat+Pac arm (t_aesi_ctc_DSIPAC_B_SE). No paclitaxel dose reduction was reported (t_aesi_ctc_DSRPAC_B_SE).

Overall, the majority of thrombocytopenia events had resolved (Ipat+Pac: 75% vs. Pbo+Pac arm: 100%) (t_aesiout_B_SE).

Cohort C

Selected AEs in the category of thrombocytopenia were reported in 3 patients (2.9%) (t_aesi_C_SE).

One patient (1.0%) experienced Grade 3 thrombocytopenia (PT: platelet count decreased) and the remaining two events of thrombocytopenia were Grade 1 in intensity (t_aesi_ctc_C_SE). No thrombocytopenia events were reported as serious (t_aesi_SER_C_SE).

No thrombocytopenia events led to discontinuation or dose reduction of any study treatments (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE, t_aesi_ctc_DSCPAC_C_SE). No ipatasertib or atezolizumab dose interruption was reported (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIATZ_C_SE). Paclitaxel dose interruption due to thrombocytopenia was reported in 1 patient (1.0%) (t_aesi_ctc_DSIPAC_C_SE). No dose reduction of any study treatment due to thrombocytopenia was reported (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSRPAC_C_SE).

Overall, all thrombocytopenia events had resolved (t_aesiout_C_SE).

See Hematology for laboratory assessment of thrombocytes.

5.2.2.6.15 Colitis

Cohort A

Selected AEs in the category of colitis were reported in one patient (0.6%) in the Ipat+Pac arm and one patient in the Pbo+Pac arm (1.1%) (t_aesi_A_SE) and both events were Grade 3 in intensity (t_aesi_ctc_A_SE).

One patient had a serious Grade 3 colitis event (PT: colitis) in the Pbo + Pac arm that led to dose interruption of placebo and paclitaxel (l_aesi_A_SE, t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSIPAC_A_SE). No other paclitaxel dose interruption was reported and no ipatasertib dose interruption was reported (t_aesi_ctc_DSIPAC_A_SE, t_aesi_ctc_DSIIPAT_A_SE). No study treatment discontinuation due to colitis was reported (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose reduction due to colitis was reported in 1 patient (0.6%) (t_aesi_ctc_DSRIPAT_A_SE). No paclitaxel dose reduction due to colitis was reported (t_aesi_ctc_DSRPAC_A_SE).

All colitis events had resolved (t_aesiout_A_SE).

Narratives for patients who experienced Grade ≥ 2 colitis/enterocolitis events are appended.

Cohort B

Selected AEs in the category of colitis were reported in 2 patients (1.4%) in the Ipat+Pac arm and none in the Pbo+Pac arm (t_aesi_B_SE).

One patient (0.7%) had a serious Grade 3 colitis event (PT: enterocolitis) in the Ipat+Pac arm (t_aesi_ctc_SER_B_SE). No study treatment discontinuation due to colitis was reported

(t_aesi_ctc_DSCIPAT_B_SE, t_aesi_ctc_DSCPAC_B_SE). Ipatasertib and paclitaxel dose interruptions due to colitis were each reported in 2 patients (1.4%) (t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSIPAC_B_SE). No ipatasertib or paclitaxel dose reduction due to colitis was reported (t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSRPAC_B_SE).

All colitis events had resolved (t_aesiout_B_SE).

Narratives for patients who experienced Grade ≥ 2 colitis/enterocolitis events are appended.

Cohort C

No selected AEs in the category of colitis were reported in Cohort C (t_aesi_C_SE).

5.2.2.6.16 Peripheral Neuropathy

Cohort A

The proportions of patients with selected AEs in the category of peripheral neuropathy were similar between treatment arms (Ipat+Pac: 86 patients [51.8%] vs. Pbo+Pac: 49 patients [56.3%]) (t_aesi_A_SE).

The majority of peripheral neuropathy events were Grade 1 or Grade 2. Grade 3 events were reported among 9.6% of patients in the Ipat + Pac arm and 5.7% of patients in the Pbo + Pac arm, respectively. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_A_SE). No peripheral neuropathy events were reported as serious (t_aesi_SER_A_SE). Paclitaxel treatment discontinuation due to peripheral neuropathy was reported in 13 patients (7.8%) in the Ipat+Pac arm and 9 patients (10.3%) in the Pbo+Pac arm. No patients discontinued ipatasertib in the Ipat+Pac arm due to peripheral neuropathy. (t_aesi_ctc_DSCPAC_A_SE, t_aesi_ctc_DSCIPAT_A_SE). Ipatasertib dose interruption due to peripheral neuropathy was reported in 2 patients (1.2%) in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_A_SE). Paclitaxel dose interruption due to peripheral neuropathy was reported in 4 patients (2.4%) in the Ipat+Pac arm and 2 patients (2.3%) in the Pbo+Pac arm (t_aesi_ctc_DSIPAC_A_SE). Ipatasertib dose reduction due to peripheral neuropathy was reported in 1 patient (0.6%) (t_aesi_ctc_DSRIPAT_A_SE). Paclitaxel dose reduction due to peripheral neuropathy was reported in 13 patients (7.8%) in the Ipat+Pac arm and 3 patients (3.4%) in the Pbo+Pac arm (t_aesi_ctc_DSRPAC_A_SE).

Overall, 36.6% of peripheral neuropathy events resolved in the Ipat+Pac arm and 29.3% in the Pbo+Pac arm (t_aesiout_A_SE).

Cohort B

The proportions of patients with selected AEs in the category of peripheral neuropathy were similar between treatment arms (Ipat+Pac: 94 patients [64.8%] vs. Pbo+Pac: 49 patients [65.3%]) (t_aesi_B_SE).

The majority of peripheral neuropathy events were Grade 1 or Grade 2. Grade 3 events were reported among 10.3% of patients in the Ipat + Pac arm and 9.3% of patients in the

Pbo + Pac arm, respectively. No events of Grade 4 or Grade 5 intensity were reported in either treatment arm (t_aesi_ctc_B_SE). No peripheral neuropathy events were reported as serious (t_aesi_SER_B_SE). No patients in the Ipat + Pac arm discontinued ipatasertib treatment due to peripheral neuropathy. Twenty-two patients (15.2%) and 7 patients (9.3%) discontinued paclitaxel due to peripheral neuropathy in the Ipat+Pac arm and Pbo+Pac arm, respectively (t_aesi_ctc_DSCPAC_B_SE, t_aesi_ctc_DSCIPAT_B_SE). Ipatasertib dose interruptions due to peripheral neuropathy was reported in 3 patients (2.1%) in the Ipat+Pac arm (t_aesi_ctc_DSIIPAT_B_SE). Paclitaxel dose interruption due to peripheral neuropathy was reported in 7 patients (4.8%) in the Ipat+Pac arm and 3 patients (4.0%) in the Pbo+Pac arm (t_aesi_ctc_DSIPAC_B_SE). Ipatasertib dose reduction due to peripheral neuropathy was reported in 1 patient (0.7%) (t_aesi_ctc_DSRPAC_B_SE). Paclitaxel dose reduction due to peripheral neuropathy was reported in 19 patient (13.1%) in the Ipat+Pac arm and 7 patients (9.3%) in the Pbo+Pac arm (t_aesi_ctc_DSRPAC_B_SE).

Overall, 31.6% of peripheral neuropathy events resolved in the Ipat+Pac arm and 26.6% in the Pbo+Pac arm (t_aesiout_B_SE).

Cohort C

Selected AEs in the category of peripheral neuropathy were reported in 53 patients (52.0%) (t_aesi_C_SE).

The majority of peripheral neuropathy events were Grade 1 or Grade 2. Grade 3 events were reported among 8.8% of patients. No events of Grade 4 or Grade 5 intensity were reported (t_aesi_ctc_C_SE). No peripheral neuropathy events were reported as serious (t_aesi_SER_C_SE). No patients discontinued ipatasertib or atezolizumab treatment due to peripheral neuropathy (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE). Eleven patients (10.8%) discontinued paclitaxel treatment due to peripheral neuropathy (t_aesi_ctc_DSCPAC_C_SE). No ipatasertib or atezolizumab dose interruption due to peripheral neuropathy was reported but paclitaxel dose interruption due to peripheral neuropathy was reported in 2 patients (2.0%) (t_aesi_ctc_DSIATZ_C_SE, t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE). No ipatasertib dose reduction due to peripheral neuropathy was reported but paclitaxel dose reduction due to peripheral neuropathy was reported in 11 patients (10.8%) (t_aesi_ctc_DSRPAC_C_SE).

Overall, 29.2% of the peripheral neuropathy events resolved (t_aesiout_C_SE).

5.2.2.6.17 Pneumonia

Cohort A

The proportions of patients with selected AEs in the pneumonia category were similar between treatment arms (Ipat+Pac: 8 patients [4.8%] vs. Pbo+Pac: 5 patients [5.7%]) (t_aesi_A_SE).

Three patients (1.8%) in the Ipat+Pac arm experienced Grade 3 pneumonia. One patient (1.1%) in the Pbo+Pac arm experienced Grade 4 pneumonia. No Grade 5 pneumonia events were reported (t_aesi_ctc_A_SE).

Serious pneumonia events were experienced by 3 patients in the Ipat+Pac arm (all Grade 3) and 4 patients in the Pbo+Pac arm (Grade 3: 3 patients [3.4%], Grade 4: 1 patient [1.1%]) (t_aesi_ctc_SER_A_SE).

In the Ipat+Pac arm, 1 patient discontinued ipatasertib due to pneumonia. One patient also discontinued paclitaxel due to pneumonia. No patients led to discontinuation of any study treatment in the Pbo+Pac arm due to pneumonia (t_aesi_ctc_DSCIPAT_A_SE, t_aesi_ctc_DSCPAC_A_SE). Ipatasertib dose interruption due to pneumonia was reported in 3 patients (1.8%) in the Ipat+Pac arm, while paclitaxel dose interruption due to pneumonia was reported in 3 patients in each arm (Ipat+Pac: 1.8% vs. Pbo+Pac: 3.4%) (t_aesi_ctc_DSIIPAT_A_SE, t_aesi_ctc_DSIPAC_A_SE). No dose reduction of any study treatment was reported due to pneumonia (t_aesi_ctc_DSRIPAT_A_SE, t_aesi_ctc_DSRPAC_A_SE).

The majority of pneumonia events had resolved (87.5% vs 100%) (t_aesiout_A_SE).

Cohort B

The proportions of patients with selected AEs in the pneumonia category were similar between treatment arms (Ipat+Pac: 6 patients [4.1%] vs. Pbo+Pac: 4 patients [5.3%]) (t_aesi_B_SE).

The majority of pneumonia events were Grade 1 or Grade 2. Serious pneumonia events (PT: pneumonia) were experienced by 2 patients (1.4%) in the Ipat+Pac arm (Grade 2 and Grade 5) and 1 patient (1.3%) (Grade 3) in the Pbo+Pac arm (t_aesi_SER_B_SE). For the one patient (0.7%) in the Ipat+Pac arm who experienced the Grade 5 pneumonia event, it was determined as not related to study treatment by the investigator (t_aesi_ctc_B_SE, l_aesi_B_SE, t_aesi_ctc_DSCIPAT_B_SE, t_aesi_ctc_DSCPAC_B_SE). Paclitaxel dose interruption due to pneumonia was reported in 3 patients (4%) in the Pbo+Pac arm (t_aesi_ctc_DSIIPAT_B_SE, t_aesi_ctc_DSIPAC_B_SE). No ipatasertib dose interruption and no dose reduction of any study treatment due to pneumonia was reported (t_aesi_ctc_DSRIPAT_B_SE, t_aesi_ctc_DSRPAC_B_SE).

Except for the one Grade 5 event (see Deaths), all other events of pneumonia had resolved (t_aesiout_B_SE).

Cohort C

Selected AEs in the pneumonia category was reported in 7 patients (6.9%) (t_aesi_C_SE).

The majority of pneumonia events were reported as Grade 1 or Grade 2 in intensity. A serious Grade 2 and a serious Grade 3 pneumonia event were reported in 1 patient (1.0%) each. One Grade 5 pneumonia event was reported after the 28-day reporting period for ipatasertib, which was not related to any study medications. All study

medications had been previously discontinued due to the AE of pneumonitis, which was reported as related to atezolizumab (see Safety Analysis for AE reporting period) (t_aesi_ctc_C_SE, t_aesi_SER_C_SE, l_aesi_C_SE).

No patients discontinued ipatasertib due to pneumonia. (t_aesi_ctc_DSCIPAT_C_SE, t_aesi_ctc_DSCATZ_C_SE, t_aesi_ctc_DSCPAC_C_SE). Ipatasertib and paclitaxel dose interruption due to pneumonia was reported in 1 patient (1.0%) and 3 patients (2.9%), respectively (t_aesi_ctc_DSIIPAT_C_SE, t_aesi_ctc_DSIPAC_C_SE). No atezolizumab dose interruption due to pneumonia was reported (t_aesi_ctc_DSIATZ_C_SE). No ipatasertib or paclitaxel dose reduction was reported (t_aesi_ctc_DSRIPAT_C_SE, t_aesi_ctc_DSRPAC_C_SE).

The majority of the pneumonia events had resolved (85.7%) (t_aesiout_C_SE).

5.2.3 Clinical Laboratory Evaluation

Cohort A

Overall, few patients experienced clinically relevant shifts from baseline (defined as those who did not have a baseline NCI CTCAE grade of Grade 3–4 for the specific laboratory abnormality and shifted to Grade 3–4 postbaseline) during study treatment (Table 67).

The most common clinically relevant shifts were hematologic toxicities (see Hematology) and abnormalities in liver function tests (see Chemistry).

In general, laboratory abnormalities observed in the study are consistent with the safety profile of known risks of each individual study drug.

A summary of safety laboratory tests with highest NCI CTCAE grade postbaseline (t_lb_cb_grdmax_A_SE), and a listing (l_lb_mabn_A_SE) of laboratory abnormalities are appended.

Table 67 Summary of Clinically Relevant Shifts from Baseline in Laboratory Safety Parameters (Cohort A, Safety Evaluable Population)

Laboratory Test Shifts to NCI-CTCAE Grade 3-4 Post-Baseline, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

Laboratory Test	Direction of Abnormality	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)
Chemistry			
Albumin	Low	0/86	2/166 (1.2%)

Total Leukocyte Count	Low	4/86 (4.7%)	13/166 (7.8%)
	High	1/86 (1.2%)	1/166 (0.6%)

For each patient, baseline is the last observation prior to initiation of study drug. For each laboratory test, patients with at least 1 post-baseline assessment are included in the analysis. For each cell, the denominator is the number of patients with baseline extended NCI-CTCAE v4 Grade 0-2 in the specified direction of abnormality, or Grade 1-4 in the opposite direction of abnormality. Patients with missing baseline values are included in the denominator.

Cohort B

Overall, few patients experienced clinically relevant shifts from baseline (defined as those who did not have a baseline NCI CTCAE grade of Grade 3–4 for the specific laboratory abnormality and shifted to Grade 3–4 postbaseline) during study treatment (Table 68).

The most common clinically relevant shifts were hematologic toxicities (see Hematology) and abnormalities in liver function tests (see Chemistry).

In general, laboratory abnormalities observed in the study are consistent with the safety profile of known risks of each individual study drug.

A summary of safety laboratory tests with highest NCI CTCAE grade postbaseline (t_lb_cb_grdmax_B_SE), and a listing (l_lb_mabn_B_SE) of laboratory abnormalities are appended.

5.2.3.1 Hematology

Cohort A

The most common clinically relevant shifts from baseline in hematology parameters (≥5% incidence in either arm) were: low values for absolute neutrophils (Ipat+Pac: 15.1% vs. Pbo+Pac: 10.5%), lymphocytes (10.9% vs. 4.8%), and leukocytes (7.8% vs. 4.7%) (Table 67).

Aside from low absolute neutrophil, lymphocyte, and leukocyte counts, no other hematology parameter had clinically relevant shifts that were more frequently reported (i.e., with ≥2% difference) in the Ipat+Pac arm compared with the Pbo+Pac arm.

Laboratory hematology shifts in NCI CTCAE grade postbaseline in the high (t_lb_shift_high_HEM_A_SE) or low direction (t_lb_shift_low_HEM_A_SE) are appended.

Cohort B

The most common clinically relevant shifts from baseline in hematology parameters (≥5% incidence in either arm) were: low values for absolute neutrophils (Ipat+Pac: 17.4% vs. Pbo+Pac: 16.2%), lymphocytes (14.4% vs. 13.5%), leukocytes (13.9% vs. 12.0%), and hemoglobin (4.9% vs. 5.3%) (Table 68).

None of the hematology parameters had clinically relevant shifts that were more frequently reported (i.e., with ≥2% difference) in the Ipat+Pac arm compared with the Pbo+Pac arm.

Laboratory hematology shifts in NCI CTCAE grade postbaseline in the high (t_lb_shift_high_HEM_B_SE) or low direction (t_lb_shift_low_HEM_B_SE) are appended.

Cohort C

The most common clinically relevant shifts from baseline in hematology parameters (≥5% incidence) were: low values for absolute neutrophils (10.8%), lymphocytes (16.7%), and leukocytes (9.8%) (Table 69).

Aside from low absolute neutrophil and lymphocyte counts, no other hematology parameter had clinically relevant shifts.

Laboratory hematology shifts in NCI CTCAE grade postbaseline in the high (t_lb_shift_high_HEM_C_SE) or low direction (t_lb_shift_low_HEM_C_SE) are appended.

5.2.3.2 Chemistry

Cohort A

The most common clinically relevant shift from baseline in laboratory chemistry parameters (≥5% incidence in either arm) were: elevated serum glutamic-pyruvic transaminase/alanine aminotransferase (SGPT/ALT) (Ipat+Pac: 6.0% vs Pbo+Pac: 3.5%), elevated glucose (7.1% vs. 0), and low sodium (4.9% vs. 7.1%) (Table 67).

The incidences of other clinically relevant shifts in laboratory chemistry parameters were comparable between the treatment arms. Aside from elevated SGPT/ALT and low phosphorus, no other chemistry parameters had clinically significant shifts that were more frequently reported (i.e., with ≥2% difference) in the Ipat+Pac arm compared with the Pbo+Pac arm.

Laboratory chemistry shifts in NCI CTCAE grade postbaseline in the high (t_lb_shift_high_CHEM_A_SE) or low direction (t_lb_shift_low_CHEM_A_SE) are appended.

Cohort B

The most common clinically relevant shift from baseline in laboratory chemistry parameters (≥5% incidence in either arm) were: elevated alkaline phosphatase (Ipat+Pac: 4.2% vs. Pbo+Pac: 8.2%), elevated SGPT/ALT (8.3% vs 8.2%), elevated serum glutamic-oxaloacetic transaminase/aspartate aminotransferase (SGOT/AST) (7.7% vs. 10.8%), elevated fasting lipase (5.3% vs. 3.1%), and elevated magnesium level (2.1% vs. 5.5%) (Table 68).

The incidences of other clinically relevant shifts in laboratory chemistry parameters were comparable between the treatment arms. Aside from fasting lipase, no other chemistry parameters had clinically significant shifts that were more frequently reported (i.e., with ≥2% difference) in the Ipat+Pac arm compared with the Pbo+Pac arm.

Laboratory chemistry shifts in NCI CTCAE grade postbaseline in the high (t_lb_shift_high_CHEM_B_SE) or low direction (t_lb_shift_low_CHEM_B_SE) are appended.

Cohort C

The most common clinically relevant shift from baseline in laboratory chemistry parameters (≥5% incidence) were: elevated alkaline phosphatase (5.9%), elevated SGPT/ALT (12.7%), elevated SGOT/AST (10.8%), low potassium level (5.9%), and low sodium level (8.8%) (Table 69).

No other chemistry parameters had clinically significant shifts.

Laboratory chemistry shifts in NCI CTCAE grade postbaseline in the high (t_lb_shift_high_CHEM_C_SE) or low direction (t_lb_shift_low_CHEM_C_SE) are appended.

5.2.3.2.1 Hy's Law

Cohort A

There were no cases of drug-induced liver injury (by PT) or AESI of potential drug-induced liver injury as defined by Hy's law reported by investigators.

Potential Hy's law cases were identified for review based on the following criteria: any patient with elevated ALT or AST (>3x upper limit of normal [ULN]) and with elevated total bilirubin (>2x ULN) within 7 days after the AST/ALT increase. No cases of potential hy's law were identified using these laboratory criteria.

A summary and listing of patients meeting laboratory criteria for Hy's law are appended (t_lb_hy_A_SE, l_lb_hy_A_SE).

Cohort B

There were no cases of drug-induced liver injury (by PT) or AESI of potential drug-induced liver injury as defined by Hy's law reported by investigators.

Potential Hy's law cases were identified for review based on the following criteria: any patient with elevated ALT or AST (>3x ULN) and with elevated total bilirubin (>2x ULN) within 7 days after the AST/ALT increase.

A total of 9 patients (Ipat+Pac: 4 patients vs. Pbo+Pac: 5 patients) were identified as potential Hy's law cases (Table 70). A detailed medical review showed that none of these cases met the criteria of Hy's law.

A listing of patients meeting laboratory criteria for Hy's law is appended (l_lb_hy_B_SE).

Table 70 Summary of Patient Laboratory Criteria for Hy's Law (Cohort B, Safety Evaluable Population)

Hy`s Law, Cohort B: HR+/HER2- Patients, Safety Evaluable Population

Cohort C

There were no cases of drug-induced liver injury (by PT) or AESI of potential drug-induced liver injury as defined by Hy's law reported by investigators.

Potential Hy's law cases were identified for review based on the following criteria: any patient with elevated ALT or AST (>3x ULN) and with elevated total bilirubin (>2x ULN) within 7 days after the AST/ALT increase.

A total of 2 patients were identified as potential Hy's law cases (Table 71). A detailed medical review showed that none of these cases met the criteria of Hy's law.

A listing of patients meeting laboratory criteria for Hy's law is appended (l_lb_hy_C_SE).

5.2.3.3 Coagulation

Cohort A

Clinically relevant shifts in NCI CTCAE grade from baseline for laboratory coagulation parameters were reported for elevated international normalized ratio (Ipat+Pac: 1.5% vs. Pbo+Pac: 0) and elevated activated partial thromboplastin time (0.8% vs. 1.6%) (Table 67).

Laboratory coagulation shift in NCI CTCAE grade postbaseline in the high direction (t_lb_shift_high_COAG_A_SE) is appended.

Cohort B

There were no clinically relevant shifts in NCI CTCAE grade from baseline for any laboratory coagulation parameters (Table 68).

Laboratory coagulation shift in NCI CTCAE grade postbaseline in the high direction (t_lb_shift_high_COAG_B_SE) is appended.

Cohort C

There were no clinically relevant shifts in NCI CTCAE grade from baseline for any laboratory coagulation parameters (Table 69).

Laboratory coagulation shifts in NCI CTCAE grade postbaseline in the high direction (t_lb_shift_high_COAG_C_SE) is appended.

5.2.4 Other Safety Evaluation

5.2.4.1 Vital Signs

There were no clinically relevant differences between the treatment arms with respect to vital sign parameters during the study in all cohorts.

A summary of vital signs by visit (with change from baseline) for each cohort (t_vs_cb_A_SE; t_vs_cb_B_SE; t_vs_cb_C_SE) is appended.

5.2.4.2 Electrocardiograms (ECG)

Cohort A

One patient in the Pbo+Pac arm had clinically significant abnormal electrocardiogram (ECG) recordings reported postbaseline at the study drug discontinuation visit and no AE was reported for this (t_eg_shift_A_SE).

One patient in the Ipat+Pac arm had clinically significant abnormal ECG recordings reported postbaseline. The patient had an SAE of Grade 1 atrial fibrillation which was considered related to ipatasertib and study disease. Atrial fibrillation was treated with a beta blocker, and ipatasertib and paclitaxel were interrupted due to the event. Subsequent ECG recordings were assessed as abnormal, but non-clinically significant.

Cohort B

One patient in the Pbo+Pac arm had clinically significant abnormal ECG recordings reported during study treatment (Day 337) with a corresponding AE of Grade 1 sinus tachycardia (t_eg_shift_B_SE). The AE had resolved without requiring treatment discontinuation or dose modification. Another patient had clinically significant abnormal ECG recordings (Day 582), but subsequent ECG recording was abnormal but not clinically signficant.

In the Ipat+Pac arm, one patient had clinically significant abnormal ECG recordings reported during study treatment (Day 157); this patient had abnormal but not clinically significant ECGs on Day 153 associated with an AE of Grade 2 sinus tachycardia (Day 155); this event had not resolved. Another patient had clinically significant abnormal ECG recordings at study drug discontinuation (Day 262) with no corresponding AEs reported.

Cohort C

Two patients had clinically significant abnormal ECG recordings reported postbaseline (t_eg_shift_C_SE). One patient had clinically significant ECG abnormality recording on Day 62, with no corresponding AE reported. Another patient had an AE of Grade 1 sinus tachycardia which had not resolved.

5.2.4.3 ECOG Performance Status

ECOG PS at baseline and shifts in ECOG PS from baseline were for Cohort A and B were reported in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), respectively.

For Cohort C, patients either had a baseline ECOG PS of 0 or 1. No patient had a baseline ECOG PS of ≥2 (Table 16).

5.2.4.4 Pregnancies

No pregnancies were reported in the study. At the time of the primary analyses, false pregnancy tests were reported for 1 patient and 2 patients in Cohorts A (see Report No. 1101889) and B (see Report No. 1100941), respectively, and there are no changes. No positive pregnancy tests were reported for Cohort C (l_lb_preg_C_SE).

5.3 PHARMACOKINETICS

Ipatasertib

Plasma samples for PK characterization of ipatasertib and its metabolite G-037720, were analyzed on Day 1 and Day 15 of Cycle 1 and on Day 15 of Cycle 3 from all patients who received ipatasertib. Patients who had at least one evaluable plasma sample were included in this PK analysis. In this study, there were 101 PK-evaluable patients.

Twelve samples were excluded from the descriptive statistics. These samples had concentrations that were below the limit of quantification post the first dose for ipatasertib and G-037720, which was considered pharmacokinetically not feasible.

A summary of plasma concentrations of ipatasertib and G-037720 at the nominal times of collection is shown in Table 72 and Table 73, respectively. The geometric mean plasma concentration of ipatasertib at 1–3 hours post dose ($C_{1\text{-}3hr}$) (geometric mean coefficient of variation [geoCV%]) increased from 175 ng/mL (183%) on Day 1 of Cycle 1 to 233 ng/mL (161.6%) on Day 15 of Cycle 1 upon multiple dosing to steady state. The geometric mean (geoCV%) plasma concentration of ipatasertib at 2–4 hours postdose at steady state ($C_{2\text{-}4hr,ss}$) on Day 15 of Cycle 3 was 207 ng/mL (197.6%). The geometric mean (geoCV%) predose concentrations at steady state ($C_{min,ss}$) on Day 15 of Cycles 1 and 3 were comparable (48.5 ng/mL [156.9%] and 46 ng/mL [120.3%], respectively).

The geometric mean plasma concentration of G-037720 at 1–3 hours post dose ($C_{1\text{-}3hr}$) (geoCV%) increased from 67.3 ng/mL (222.3%) on Day 1 of Cycle 1 to 96.8 ng/mL (140.7%) on Day 15 of Cycle 1 upon multiple dosing. The geometric mean (geoCV%) plasma concentration of G-037720 at 2–4 hours postdose at steady state ($C_{2\text{-}4hr,ss}$) on Day 15 of Cycle 3 was 96.5 ng/mL (167.9%). The geometric mean (geoCV%) predose concentrations at steady state ($C_{min,ss}$) on Day 15 of Cycles 1 and 3 were comparable (26.9 ng/mL [133.2%] and 24.5 ng/mL [87%], respectively).

Table 72 Ipatasertib Plasma Concentrations at Nominal Sampling Times (PK Evaluable Population)

	Day 1 of Cycle 1	Day 15 of Cycle 1		Day 15 of Cycle 3	
	$C_{1\text{-}3hr}$	$C_{min,ss}$	$C_{1\text{-}3hr,ss}$	$C_{min,ss}$	$C_{2\text{-}4hr,ss}$

Atezolizumab

A summary of serum concentrations of atezolizumab at the nominal times of collection is shown in t_pkc_atzo.

5.4 IMMUNOGENICITY

Atezolizumab

The incidence of treatment-emergent ADAs was 17.8% (18/101) in the treatment-emergent ADA-evaluable population (Table 74).

A bioanalytical report (CO40016 ADA ICON 188357 Final BAR) including immunogenicity data is appended.

Table 74 Baseline Prevalence and Postbaseline Incidence of Atezolizumab Anti-Drug Antibodies

Baseline Prevalence and Post-Baseline Incidence of Anti-Drug Antibodies (ADAs) to Atezolizumab (RO5541267)
Safety Population
Protocol: CO40016

	COHORT C IPATASERTIB + ATEZOLIZUMAB + PACLITAXEL (n=102)
Baseline Prevalence of ADAs	
Baseline evaluable patients	99
Patients with a positive sample at baseline	0 (0.0%)
Patients with no positive samples at baseline	99
Incidence of Treatment Emergent ADAs	
Post-baseline evaluable patients	101
Patients positive for Treatment Emergent ADA	18 (17.8%)
Treatment-induced ADA	18
Treatment-enhanced ADA	0
Patients negative for Treatment Emergent ADA	83
Treatment unaffected	0

ADA = Anti-Drug Antibodies (is also referred to as ATA, or Anti-Therapeutic Antibodies).
Baseline evaluable patient = a patient with an ADA assay result from a baseline sample.
Post-baseline evaluable patient = a patient with an ADA assay result from at least one post-baseline sample.
Number of patients positive for Treatment Emergent ADA = the number (and percentage) of post-baseline evaluable patients determined to have treatment-induced ADA or treatment-enhanced ADA during the study period.
Treatment-induced ADA = a patient with negative or missing baseline ADA result(s) and at least one positive post-baseline ADA result.
Treatment-enhanced ADA = a patient with positive ADA result at baseline who has one or more post-baseline titer results that are at least 0.60 t.u. greater than the baseline titer result.
Number of patients negative for Treatment Emergent ADA = number of post-baseline evaluable patients with negative or missing baseline ADA result(s) and all negative post-baseline results, or a patient who is treatment unaffected.
Treatment unaffected = A post-baseline evaluable patient with a positive ADA result at baseline and (a) where all post-baseline titer results are less than 0.60 t.u. greater than the baseline titer result, OR (b) where all post-baseline results are negative or missing.
For any positive sample with titer result less than the minimum reportable titer or any positive sample where a titer cannot be obtained, titer value is imputed as equal to the minimum reportable titer.

5.5 SUMMARY OF EVALUATION OF RESPONSE TO STUDY TREATMENT

Study CO40016 was designed to assess the efficacy and safety of ipatasertib in combination with paclitaxel in patients with *PIK3CA/AKT1/PTEN*-altered locally advanced unresectable or metastatic TNBC (Cohort A) or HR+/HER2− breast cancer (Cohort B) with no prior systemic treatment in the locally advanced/metastatic setting. Study CO40016 included a single-arm open-label cohort (Cohort C) to assess the safety and efficacy of ipatasertib in combination with atezolizumab and paclitaxel in TNBC

patients without *PIK3CA/AKT1/PTEN*-altered tumors. The primary endpoint was INV-assessed PFS per RECIST v1.1 and the key secondary endpoint was OS.

Efficacy

As discussed in the primary CSR for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941), Study CO40016 did not meet its primary endpoint, PFS. As such, the final OS analysis results were considered descriptive and there was no clinically meaningful benefit observed in OS with ipatasertib in combination with paclitaxel over paclitaxel alone in patients with *PIK3CA/AKT1/PTEN*-altered, locally advanced or metastatic TNBC (Cohort A) or HR+/HER2- breast cancer (Cohort B). While efficacy results for Cohort C were descriptive in nature, the median duration of PFS and OS were consistent with the Ipat+Pac arm in Cohort A.

Patient-Reported Outcomes

For Cohort C, the patient experience was characterized through prespecified patient-reported endpoints of mean and mean changes from baseline in health-related QoL (HRQoL) through the GHS/QoL scale of the EORTC QLQ-C30 questionnaire. Completion rates at baseline (Cycle 1, Day 1) was high at 100% and remained high through Cycle 7, with mean change from baseline remaining within 8 points of the baseline score. Patients' baseline HRQoL was maintained while receiving treatment, with no clinically meaningful deterioration in patients' GHS/QoL observed. Patient-reported outcome results demonstrated that adding ipatasertib in combination with atezolizumab and paclitaxel for the treatment of patients with locally advanced unresectable or metastatic TNBC did not result in a detrimental effect to patients' overall HRQoL.

Safety

The safety profile of ipatasertib in combination with paclitaxel remained consistent with the safety profile reported in the primary CSR for Cohorts A and B. The safety profile of ipatasertib in combination with atezolizumab and paclitaxel (Cohort C) was consistent with the known risks of each individual study drug and no new safety signals were identified across cohorts.

<u>Cohort A</u>

- Most patients in each treatment arm experienced at least one AE of any grade (Ipat+Pac: 162 patients [97.6%] vs. Pbo+Pac: 84 patients [96.6%]).
- Grade ≥3 AEs were reported in a similar proportion of patients between treatment arms for Cohort A (Ipat + Pac: 84 patients [50.6%] vs. Pbo + Pac: 40 patients [46.0%]).
- The most common Grade ≥3 AEs (by PT) reported in ≥5% of patients in either treatment arm were: diarrhea (Ipat+Pac: 9% vs. Pbo+Pac: 2.3%), neutrophil count decreased (4.8% vs. 5.7%), and neutropenia (7.2% vs. 4.6%)

- A total of 132 deaths were reported in the safety evaluable population (Ipat+Pac: 91 patients [54.8%] vs. Pbo+Pac: 41 patients [47.1%]). The primary cause of death was progressive disease. Deaths due to AEs were reported in 2 patients in each treatment arm.
- Grade 5 AEs occurred in a low number of patients (Ipat+Pac: 2 patients [1.2%] vs. Pbo+Pac: 2 patients [2.3%]). Of these Grade 5 AEs, one AE (PT: tumor lysis syndrome) in the Pbo + Pac arm was considered related to both placebo and paclitaxel.
- Similar proportions of SAEs were reported between the Ipat + Pac arm (20.5%) and the Pbo + Pac arm (23%). SAEs (by PT) reported in ≥1% of patients (i.e., ≥2 patients) in the Ipat + Pac arm were: diarrhea, febrile neutropenia, pulmonary embolism, pneumonia, nausea, and vomiting. Two SAEs (by PT) were reported in more than 1 patient in the Pbo + Pac arm: pneumonia and pleural effusion.
- The proportion of patients with AEs leading to ipatasertib/placebo treatment discontinuation was higher in the Ipat+Pac arm compared with the Pbo+Pac arm (Ipat+Pac: 10.2% vs. Pbo+Pac: 6.9%). AEs (by PT) leading to ipatasertib treatment discontinuation occurring in ≥1% of patients (i.e., ≥2 patients) in the Ipat + Pac arm were diarrhea, pulmonary embolism, and hyperglycemia.
- The proportions of patients with AEs leading to paclitaxel treatment discontinuation in the Ipat+Pac arm and in the Pbo+Pac arm were 15.1% and 16.1%, respectively. AEs (by PT) leading to paclitaxel treatment discontinuation occurring in ≥2 patients in either treatment arm were neuropathy peripheral, peripheral sensory neuropathy, polyneuropathy, diarrhea, and pulmonary embolism.
- The incidence of selected AEs was consistent with known safety profile of ipatasertib, and in general were manageable and reversible. Selected AEs were reported in both treatment arms (Ipat+Pac: 94.6% vs. Pbo+Pac: 90.8%).

Cohort B

- Most patients in each treatment arm experienced at least one AE of any grade (144 patients [99.3%] vs. 74 patients [98.7%]).
- Grade ≥3 AEs were reported in a higher proportion of patients in the Ipat+Pac arm compared with the Pbo+Pac arm (83 patients [57.2%] vs. 37 patients [49.3%]).
- The most common Grade ≥3 AEs (by PT) reported in ≥5% of patients in either treatment arm were: diarrhea (Ipat+Pac: 11.7% vs. Pbo+Pac: 1.3%), neutrophil count decreased (9% vs. 8%), neutropenia (8.3% vs. 9.3%), neuropathy peripheral (6.9% vs. 4%), peripheral sensory neuropathy (2.8% vs. 5.3%), and hypertension (1.4% vs. 5.3%).
- A total of 122 deaths were reported in the safety evaluable population (Ipat+Pac: 78 patients [53.8%] vs. Pbo+Pac: 44 patients [58.7%]). The primary cause of death was progressive disease. Deaths due to AEs were reported in 5 patients in the Ipat+Pac arm and 1 patient in the Pbo+Pac arm.
- Grade 5 AEs occurred in a low number of patients (5 patients [3.4%] vs. 1 patient [1.3%]). Of these Grade 5 AEs, one AE (PT: febrile neutropenia) in the Ipat+Pac

arm was considered related to ipatasertib and paclitaxel and led to ipatasertib and paclitaxel treatment discontinuation, and one AE (PT: sepsis) in the Pbo+Pac arm considered related to paclitaxel and led to paclitaxel treatment discontinuation, the rest of the events were not considered related to any study treatment by the investigator.

- A higher proportion of SAEs was reported in the Ipat + Pac arm (20.7%) compared with the Pbo + Pac arm (14.7%). SAEs (by PT) reported in ≥1% of patients (i.e., ≥2 patients) in the Ipat + Pac arm were: diarrhea, febrile neutropenia, pneumonia, neutropenia, and pneumonitis. No SAE (by PT) was reported in more than 1 patient in the Pbo+Pac arm.
- The proportions of patients with AEs leading to ipatasertib/placebo treatment discontinuation were higher in the Ipat+Pac arm (11.7%) compared with the Pbo+Pac arm (4%). AEs (by PT) leading to ipatasertib treatment discontinuation occurring in ≥1% of patients (i.e., ≥ 2 patients) in the Ipat + Pac arm were diarrhea, febrile neutropenia, and hyperglycemia.
- The proportions of patients with AEs leading to paclitaxel treatment discontinuation in the Ipat+Pac arm and in the Pbo+Pac arm were 29% and 16%, respectively. AEs (by PT) leading to paclitaxel treatment discontinuation occurring in ≥2 of patients in either treatment arm were neuropathy peripheral, peripheral sensory neuropathy, neurotoxicity, polyneuropathy, febrile neutropenia, neutropenia, and neutrophil count decreased.
- The incidence of selected AEs was consistent with known safety profile of ipatasertib, and in general were manageable and reversible. Selected AEs were reported in both treatment arms (Ipat+Pac: 97.2% vs. Pbo+Pac: 97.3%).

Cohort C

- All patients experienced at least one AE of any grade.
- Grade ≥3 AEs were reported in 62 patients [60.8%]. The most frequent Grade ≥3 AEs (by PT) with ≥5% incidence were alanine aminotransferase increased, aspartate aminotransferase increased, neuropathy peripheral, diarrhea and neutropenia.
- A total of 50 deaths were reported in the safety evaluable population. The primary cause of death was progressive disease. Deaths due to AEs were reported in 4 patients.
- Grade 5 AEs occurred in a low number of patients (4 patients [3.9%]). Of these Grade 5 AEs, one AE (PT: pulmonary embolism) was considered related to atezolizumab.
- The proportion of patients with at least one SAE was 28.4%. SAEs (by PT) reported in ≥2 patients) were: diarrhea, pyrexia, pneumonia, urinary tract infection, cholecystitis, dehydration, fatigue, febrile neutropenia, pneumonitis, rash, tumor necrosis, and vomiting.
- The proportion of patients with AEs leading to ipatasertib treatment discontinuation was 10.8%. AEs (by PT) leading to ipatasertib treatment discontinuation occurring

in ≥2 patients were aspartate aminotransferase increased, alanine aminotransferase increased, autoimmune hepatitis.

- The proportion of patients with AEs leading to paclitaxel treatment discontinuation was 22.5%. AEs (by PT) leading to paclitaxel treatment discontinuation occurring in ≥2 of patients were neuropathy peripheral and polyneuropathy.
- The proportion of patients with AEs leading to atezolizumab treatment discontinuation was 13.7%. The AEs (by PT) leading to atezolizumab treatment discontinuation occurring in ≥2 of patients were autoimmune hepatitis, alanine aminotransferase increased, and aspartate aminotransferase increased.
- The incidence of selected AEs was consistent with known safety profile of ipatasertib, and in general were manageable and reversible. Selected AEs were reported in 99% of patients.

Pharmacokinetics

Concentrations of ipatasertib and its metabolite, G-037720, increased after multiple dosing compared with that following a single dose. This is consistent with what is expected for ipatasertib given its half-life and the once daily dosing regimen. The steady state plasma exposures of ipatasertib and G-037720 were comparable on Cycle 1 Day 15 and Cycle 3 Day 15. The variability of ipatasertib and G-037720 concentrations at each time point observed in this study is high, partially due to the wide window of time (time range) allowed for sample collection for PK analysis.

6. CONCLUSIONS

In Study CO40016, Cohorts A and B did not meet their primary endpoint: Ipatasertib in combination with paclitaxel did not demonstrate a statistically significant and clinically meaningful improvement in investigator-assessed PFS compared with paclitaxel alone in patients with *PIK3CA/AKT1/PTEN*-altered, locally advanced or metastatic TNBC or HR+/HER2- breast cancer. The final OS results were consistent with those of the primary endpoint, with no clinically meaningful benefit observed for ipatasertib in combination with paclitaxel over paclitaxel alone for both Cohorts A and B. The efficacy results from Cohort C (ipatasertib in combination with paclitaxel and atezolizumab) were consistent with the results in the ipatasertib and paclitaxel arm in Cohort A. For patient-reported GHS/QOL, the result of adding ipatasertib to paclitaxel and atezolizumab (Cohort C) was consistent with that of adding ipatasertib to paclitaxel alone (Cohorts A and B), such that it did not result in a detrimental effect to patients' overall HRQoL.

The safety profile of the combination of ipatasertib with either paclitaxel alone (Cohort A and B) or with atezolizumab and paclitaxel (Cohort C) was consistent with the known risks of each individual study treatment component. No new safety signals were identified.

Vuylsteke P, Huizing M, Petrakova K, et al. Pictilisib PI3Kinase inhibitor (a phosphatidylinositol 3-kinase [PI3K] inhibitor) plus paclitaxel for the treatment of hormone receptor-positive, HER2-negative, locally recurrent, or metastatic breast cancer: interim analysis of the multicentre, placebo-controlled, phase II randomised PEGGY study. Ann Oncol 2016;27:2059–66.

List of Referenced Studies

Final Clinical Study Report – Protocol No. GO29227 – A randomized, phase II, multicenter, placebo-controlled study of ipatasertib (GDC-0068), an inhibitor of Akt, in combination with paclitaxel as front-line treatment for patients with metastatic triple-negative breast cancer. Report No. 1099589. March, 2020.

Interim Clinical Study Report – Protocol No. GO27845 – A phase Ib, open-label, dose-escalation study of the safety and pharmacology of GDC-0068 in combination with docetaxel, fluoropyrimidine plus oxaliplatin, paclitaxel, or enzalutamide in patients with advanced solid tumors. Report No. 1074119. June 2017.

Primary Clinical Study Report: Study CO40016, (Cohort A–Triple Negative Breast Cancer). A double-blind, placebo-controlled, randomized phase III study of ipatasertib in combination with paclitaxel as a treatment for patients with *PIK3CA/AKT1/PTEN*-altered, locally advanced or metastatic, triple-negative breast cancer or hormone receptor–positive, HER2-negative breast cancer. Report No. 1101889. November 2020.

Primary Clinical Study Report: Study CO40016, (Cohort B-Hormone Receptor Positive, HER2-Negative Breast Cancer). A double-blind, placebo-controlled, randomized phase III study of ipatasertib in combination with paclitaxel as a treatment for patients with *PIK3CA/AKT1/PTEN*-altered, locally advanced or metastatic, triple-negative breast cancer or hormone receptor–positive, HER2-negative breast cancer. Report No 1100941. July, 2020.

Total number of events	2
Blood alkaline phosphatase increased	1 (1.0%)
High density lipoprotein increased	1 (1.0%)
Respiratory, thoracic and mediastinal disorders	
Total number of patients with at least one such adverse event	1 (1.0%)
Total number of events	2
Dyspnoea exertional	1 (1.0%)
Nasal congestion	1 (1.0%)

Investigator text for AEs encoded using MedDRA version 25.1. Percentages are based on N in the column headings. For frequency counts by preferred term, multiple occurrences of such AE in an individual are counted only once. For frequency counts of "Total number of events" rows, multiple occurrences of such AE in an individual are counted separately. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

	Grade 5	1 (1.1%)	0

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Protocol: CO40016

MedDRA System Organ Class MedDRA Preferred Term	Grade	Placebo + Paclitaxel (N=75)	Ipatasertib + Paclitaxel (N=145)
COVID-19	- Any Grade -	1 (1.3%)	0
	Grade 1-2	1 (1.3%)	0
	1	1 (1.3%)	0
Diarrhoea infectious	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
Infection	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
Lower respiratory tract infection	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
Nasopharyngitis	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
Pharyngitis	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
Pneumonia	- Any Grade -	1 (1.3%)	0
	Grade 3-4	1 (1.3%)	0
	3	1 (1.3%)	0
Respiratory tract infection viral	- Any Grade -	1 (1.3%)	0
	Grade 1-2	1 (1.3%)	0
	2	1 (1.3%)	0
Wound infection	- Any Grade -	1 (1.3%)	0
	Grade 1-2	1 (1.3%)	0
	2	1 (1.3%)	0
General disorders and administration site conditions			
- Overall -	- Any Grade -	7 (9.3%)	7 (4.8%)
	Grade 1-2	4 (5.3%)	6 (4.1%)
	1	1 (1.3%)	3 (2.1%)
	2	3 (4.0%)	3 (2.1%)
	Grade 3-4	3 (4.0%)	1 (0.7%)
	3	3 (4.0%)	1 (0.7%)
Asthenia	- Any Grade -	1 (1.3%)	2 (1.4%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
	Grade 3-4	1 (1.3%)	1 (0.7%)
	3	1 (1.3%)	1 (0.7%)
Fatigue	- Any Grade -	2 (2.7%)	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
	Grade 3-4	2 (2.7%)	0
	3	2 (2.7%)	0

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.

Adverse Events Leading to Dose Interruption of Ipatasertib by Highest NCI CTCAE Grade, Cohort C: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA System Organ Class MedDRA Preferred Term	Grade	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Alanine aminotransferase increased	- Any Grade -	6 (5.9%)
	Grade 1-2	2 (2.0%)
	1	1 (1.0%)
	2	1 (1.0%)
	Grade 3-4	4 (3.9%)
	3	4 (3.9%)
Aspartate aminotransferase increased	- Any Grade -	6 (5.9%)
	Grade 1-2	3 (2.9%)
	1	2 (2.0%)
	2	1 (1.0%)
	Grade 3-4	3 (2.9%)
	3	3 (2.9%)
Neutrophil count decreased	- Any Grade -	4 (3.9%)
	Grade 3-4	4 (3.9%)
	3	4 (3.9%)
Amylase increased	- Any Grade -	1 (1.0%)
	Grade 1-2	1 (1.0%)
	2	1 (1.0%)
Blood alkaline phosphatase increased	- Any Grade -	1 (1.0%)
	Grade 1-2	1 (1.0%)
	1	1 (1.0%)
Blood bilirubin increased	- Any Grade -	1 (1.0%)
	Grade 1-2	1 (1.0%)
	2	1 (1.0%)
Blood glucose increased	- Any Grade -	1 (1.0%)
	Grade 3-4	1 (1.0%)
	3	1 (1.0%)
Blood lactate dehydrogenase increased	- Any Grade -	1 (1.0%)
	Grade 1-2	1 (1.0%)
	2	1 (1.0%)
Lipase increased	- Any Grade -	1 (1.0%)
	Grade 3-4	1 (1.0%)
	4	1 (1.0%)
Weight decreased	- Any Grade -	1 (1.0%)
	Grade 1-2	1 (1.0%)
	1	1 (1.0%)
Infections and infestations		
- Overall -	- Any Grade -	13 (12.7%)
	Grade 1-2	9 (8.8%)
	1	2 (2.0%)
	2	7 (6.9%)
	Grade 3-4	4 (3.9%)
	3	4 (3.9%)
COVID-19	- Any Grade -	3 (2.9%)
	Grade 1-2	3 (2.9%)
	1	2 (2.0%)
	2	1 (1.0%)

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Adverse Events Leading to Dose Interruption of Paclitaxel by Highest NCI CTCAE Grade, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA System Organ Class MedDRA Preferred Term	Grade	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)
Erysipelas	- Any Grade -	1 (1.1%)	0
	Grade 1-2	1 (1.1%)	0
	2	1 (1.1%)	0
Furuncle	- Any Grade -	0	1 (0.6%)
	Grade 1-2	0	1 (0.6%)
	2	0	1 (0.6%)
Influenza	- Any Grade -	1 (1.1%)	0
	Grade 1-2	1 (1.1%)	0
	2	1 (1.1%)	0
Laryngitis	- Any Grade -	0	1 (0.6%)
	Grade 1-2	0	1 (0.6%)
	2	0	1 (0.6%)
Nail infection	- Any Grade -	0	1 (0.6%)
	Grade 1-2	0	1 (0.6%)
	2	0	1 (0.6%)
Nasopharyngitis	- Any Grade -	1 (1.1%)	0
	Grade 1-2	1 (1.1%)	0
	1	1 (1.1%)	0
Periodontitis	- Any Grade -	0	1 (0.6%)
	Grade 1-2	0	1 (0.6%)
	2	0	1 (0.6%)
Skin infection	- Any Grade -	0	1 (0.6%)
	Grade 1-2	0	1 (0.6%)
	2	0	1 (0.6%)
Tooth abscess	- Any Grade -	1 (1.1%)	0
	Grade 1-2	1 (1.1%)	0
	2	1 (1.1%)	0
Tooth infection	- Any Grade -	0	1 (0.6%)
	Grade 1-2	0	1 (0.6%)
	2	0	1 (0.6%)
Urinary tract infection	- Any Grade -	0	1 (0.6%)
	Grade 3-4	0	1 (0.6%)
	3	0	1 (0.6%)
Viral infection	- Any Grade -	1 (1.1%)	0
	Grade 3-4	1 (1.1%)	0
	3	1 (1.1%)	0
Investigations			
- Overall -	- Any Grade -	10 (11.5%)	18 (10.8%)
	Grade 1-2	4 (4.6%)	12 (7.2%)
	2	4 (4.6%)	12 (7.2%)
	Grade 3-4	6 (6.9%)	6 (3.6%)
	3	6 (6.9%)	6 (3.6%)
Neutrophil count decreased	- Any Grade -	8 (9.2%)	15 (9.0%)
	Grade 1-2	4 (4.6%)	11 (6.6%)
	2	4 (4.6%)	11 (6.6%)
	Grade 3-4	4 (4.6%)	4 (2.4%)
	3	4 (4.6%)	4 (2.4%)

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Adverse Events Related to Ipatasertib/Placebo Treatment by Highest NCI CTCAE Grade, Cohort B: HR+/HER2- Patients, Safety Evaluable Population
Protocol: CO40016

MedDRA System Organ Class MedDRA Preferred Term	Grade	Placebo + Paclitaxel (N=75)	Ipatasertib + Paclitaxel (N=145)
Hypothermia	- Any Grade -	1 (1.3%)	0
	Grade 1-2	1 (1.3%)	0
	2	1 (1.3%)	0
Pain	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	2	0	1 (0.7%)
Thirst	- Any Grade -	0	1 (0.7%)
	Grade 1-2	0	1 (0.7%)
	1	0	1 (0.7%)
Investigations			
- Overall -	- Any Grade -	21 (28.0%)	33 (22.8%)
	Grade 1-2	14 (18.7%)	22 (15.2%)
	1	5 (6.7%)	11 (7.6%)
	2	9 (12.0%)	11 (7.6%)
	Grade 3-4	7 (9.3%)	11 (7.6%)
	3	6 (8.0%)	9 (6.2%)
	4	1 (1.3%)	2 (1.4%)
Alanine aminotransferase increased	- Any Grade -	9 (12.0%)	11 (7.6%)
	Grade 1-2	7 (9.3%)	7 (4.8%)
	1	3 (4.0%)	6 (4.1%)
	2	4 (5.3%)	1 (0.7%)
	Grade 3-4	2 (2.7%)	4 (2.8%)
	3	2 (2.7%)	4 (2.8%)
Neutrophil count decreased	- Any Grade -	8 (10.7%)	12 (8.3%)
	Grade 1-2	5 (6.7%)	6 (4.1%)
	1	1 (1.3%)	1 (0.7%)
	2	4 (5.3%)	5 (3.4%)
	Grade 3-4	3 (4.0%)	6 (4.1%)
	3	2 (2.7%)	5 (3.4%)
	4	1 (1.3%)	1 (0.7%)
Aspartate aminotransferase increased	- Any Grade -	6 (8.0%)	7 (4.8%)
	Grade 1-2	5 (6.7%)	6 (4.1%)
	1	4 (5.3%)	4 (2.8%)
	2	1 (1.3%)	2 (1.4%)
	Grade 3-4	1 (1.3%)	1 (0.7%)
	3	1 (1.3%)	1 (0.7%)
Blood lactate dehydrogenase increased	- Any Grade -	6 (8.0%)	3 (2.1%)
	Grade 1-2	6 (8.0%)	3 (2.1%)
	1	6 (8.0%)	3 (2.1%)
Blood alkaline phosphatase increased	- Any Grade -	3 (4.0%)	2 (1.4%)
	Grade 1-2	3 (4.0%)	2 (1.4%)
	1	1 (1.3%)	2 (1.4%)
	2	2 (2.7%)	0

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1. All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the SOC Overall row counts, a patient contributes only with the AE occurring with the highest grade within the SOC. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Adverse Events Leading to Paclitaxel Discontinuation, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA System Organ Class MedDRA Preferred Term	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)
Infections and infestations		
Total number of patients with at least one such adverse event	0	2 (1.2%)
Total number of events	0	2
Paronychia	0	1 (0.6%)
Pneumonia	0	1 (0.6%)
Blood and lymphatic system disorders		
Total number of patients with at least one such adverse event	0	1 (0.6%)
Total number of events	0	1
Neutropenia	0	1 (0.6%)
Cardiac disorders		
Total number of patients with at least one such adverse event	1 (1.1%)	0
Total number of events	1	0
Atrial fibrillation	1 (1.1%)	0
Eye disorders		
Total number of patients with at least one such adverse event	1 (1.1%)	0
Total number of events	1	0
Ocular hyperaemia	1 (1.1%)	0
Investigations		
Total number of patients with at least one such adverse event	0	1 (0.6%)
Total number of events	0	1
Neutrophil count decreased	0	1 (0.6%)
Metabolism and nutrition disorders		
Total number of patients with at least one such adverse event	1 (1.1%)	0
Total number of events	1	0
Tumour lysis syndrome	1 (1.1%)	0
Renal and urinary disorders		
Total number of patients with at least one such adverse event	1 (1.1%)	0
Total number of events	1	0
Haematuria	1 (1.1%)	0

Investigator text for AEs encoded using MedDRA version 25.1. Percentages are based on N in the column headings. For frequency counts by preferred term, multiple occurrences of such AE in an individual are counted only once. For frequency counts of "Total number of events" rows, multiple occurrences of such AE in an individual are counted separately. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Adverse Events Leading to Dose Interruption of Ipatasertib by Preferred Term, Cohort C: TNBC, Safety Evaluable Population
Protocol: CO40016

MedDRA Preferred Term	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Diarrhoea	15 (14.7%)
Neutropenia	10 (9.8%)
Alanine aminotransferase increased	6 (5.9%)
Aspartate aminotransferase increased	6 (5.9%)
Pyrexia	6 (5.9%)
Rash	6 (5.9%)
Hyperglycaemia	5 (4.9%)
Nausea	5 (4.9%)
Neutrophil count decreased	4 (3.9%)
COVID-19	3 (2.9%)
Upper respiratory tract infection	3 (2.9%)
Acute kidney injury	2 (2.0%)
Dehydration	2 (2.0%)
Influenza	2 (2.0%)
Pneumonitis	2 (2.0%)
Pruritus	2 (2.0%)
Rash maculo-papular	2 (2.0%)
Tumour necrosis	2 (2.0%)
Urinary tract infection	2 (2.0%)
Vomiting	2 (2.0%)
Accidental overdose	1 (1.0%)
Amylase increased	1 (1.0%)
Asthenia	1 (1.0%)
Autoimmune hepatitis	1 (1.0%)
Blood alkaline phosphatase increased	1 (1.0%)
Blood bilirubin increased	1 (1.0%)
Blood glucose increased	1 (1.0%)
Blood lactate dehydrogenase increased	1 (1.0%)
Bronchitis	1 (1.0%)
Cholecystitis	1 (1.0%)
Dyspnoea	1 (1.0%)
Dystonia	1 (1.0%)
Fatigue	1 (1.0%)

Investigator text for AEs encoded using MedDRA version 25.1. Percentages are based on N in the column headings. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

08MAY2023 5:36 Page 1 of 3

MedDRA System Organ Class MedDRA Preferred Term	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Hepatobiliary disorders	
Total number of patients with at least one such adverse event	4 (3.9%)
Total number of events	4
Cholecystitis	2 (2.0%)
Autoimmune hepatitis	1 (1.0%)
Hypertransaminasaemia	1 (1.0%)
Metabolism and nutrition disorders	
Total number of patients with at least one such adverse event	3 (2.9%)
Total number of events	3
Dehydration	2 (2.0%)
Diabetic ketoacidosis	1 (1.0%)
Neoplasms benign, malignant and unspecified (incl cysts and polyps)	
Total number of patients with at least one such adverse event	3 (2.9%)
Total number of events	3
Tumour necrosis	2 (2.0%)
Tumour fistulisation	1 (1.0%)
Blood and lymphatic system disorders	
Total number of patients with at least one such adverse event	2 (2.0%)
Total number of events	2
Febrile neutropenia	2 (2.0%)
Cardiac disorders	
Total number of patients with at least one such adverse event	2 (2.0%)
Total number of events	2
Cardiac arrest	1 (1.0%)
Myocarditis	1 (1.0%)
Musculoskeletal and connective tissue disorders	
Total number of patients with at least one such adverse event	2 (2.0%)
Total number of events	2
Musculoskeletal chest pain	1 (1.0%)
Myositis	1 (1.0%)
Nervous system disorders	
Total number of patients with at least one such adverse event	2 (2.0%)
Total number of events	2
Dystonia	1 (1.0%)
Posterior reversible encephalopathy syndrome	1 (1.0%)

Investigator text for AEs encoded using MedDRA version 25.1. Percentages are based on N in the column headings. For frequency counts by preferred term, multiple occurrences of such AE in an individual are counted only once. For frequency counts of "Total number of events" rows, multiple occurrences of such AE in an individual are counted separately. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

MedDRA System Organ Class MedDRA Preferred Term	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Skin and subcutaneous tissue disorders	
Total number of patients with at least one such adverse event	2 (2.0%)
Total number of events	2
Rash	2 (2.0%)
Immune system disorders	
Total number of patients with at least one such adverse event	1 (1.0%)
Total number of events	1
Hypersensitivity	1 (1.0%)
Investigations	
Total number of patients with at least one such adverse event	1 (1.0%)
Total number of events	2
Alanine aminotransferase increased	1 (1.0%)
Aspartate aminotransferase increased	1 (1.0%)
Renal and urinary disorders	
Total number of patients with at least one such adverse event	1 (1.0%)
Total number of events	1
Acute kidney injury	1 (1.0%)
Vascular disorders	
Total number of patients with at least one such adverse event	1 (1.0%)
Total number of events	1
Lymphoedema	1 (1.0%)

Investigator text for AEs encoded using MedDRA version 25.1. Percentages are based on N in the column headings. For frequency counts by preferred term, multiple occurrences of such AE in an individual are counted only once. For frequency counts of "Total number of events" rows, multiple occurrences of such AE in an individual are counted separately. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Selected Adverse Events, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

Grouped Term MedDRA Preferred Term	Placebo + Paclitaxel (N=87)	Ipatasertib + Paclitaxel (N=166)
Total number of patients with at least one such adverse event	79 (90.8%)	157 (94.6%)
Overall total number of events	404	1435
Diarrhea		
Total number of patients with at least one such adverse event	28 (32.2%)	141 (84.9%)
Total number of events	56	485
Diarrhoea	28 (32.2%)	141 (84.9%)
Peripheral neuropathy		
Total number of patients with at least one such adverse event	49 (56.3%)	86 (51.8%)
Total number of events	58	112
Neuropathy peripheral	20 (23.0%)	39 (23.5%)
Peripheral sensory neuropathy	19 (21.8%)	32 (19.3%)
Polyneuropathy	7 (8.0%)	5 (3.0%)
Paraesthesia	2 (2.3%)	8 (4.8%)
Muscular weakness	3 (3.4%)	1 (0.6%)
Neurotoxicity	1 (1.1%)	2 (1.2%)
Dysaesthesia	1 (1.1%)	1 (0.6%)
Peripheral motor neuropathy	0	2 (1.2%)
Neuralgia	0	1 (0.6%)
Toxic neuropathy	0	1 (0.6%)
Asthenia		
Total number of patients with at least one such adverse event	25 (28.7%)	63 (38.0%)
Total number of events	28	74
Fatigue	15 (17.2%)	31 (18.7%)
Asthenia	10 (11.5%)	35 (21.1%)
Nausea		
Total number of patients with at least one such adverse event	22 (25.3%)	66 (39.8%)
Total number of events	29	108
Nausea	22 (25.3%)	66 (39.8%)
Neutropenia		
Total number of patients with at least one such adverse event	31 (35.6%)	51 (30.7%)
Total number of events	63	146
Neutropenia	21 (24.1%)	28 (16.9%)
Neutrophil count decreased	10 (11.5%)	22 (13.3%)
Febrile neutropenia	0	4 (2.4%)

Investigator text for AEs encoded using MedDRA version 25.1.
All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.

All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1.
All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Investigator text for AEs encoded using MedDRA version 25.1.
All counts represent patients. Multiple occurrences of the same AE in one individual are counted once at the highest grade for this preferred term. To the Medical Concept Category Overall row counts, a patient contributes only with the AE occurring with the greatest intensity within the Medical Concept category. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

NOT RECOVERED/NOT RESOLVED	0
RECOVERED/RESOLVED	3 (100%)
RECOVERED/RESOLVED WITH SEQUELAE	0
RECOVERING/RESOLVING	0
FATAL	0
UNKNOWN	0

Multiple occurrences of the same AE in an individual are counted separately. Percentages are calculated based on 'Total Number of AE' for each grouped term. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Grouped Term Outcome Categories	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Vomiting	
Total Number of AE	46
NOT RECOVERED/NOT RESOLVED	0
RECOVERED/RESOLVED	46 (100%)
RECOVERED/RESOLVED WITH SEQUELAE	0
RECOVERING/RESOLVING	0
FATAL	0
UNKNOWN	0
Weight Decreased	
Total Number of AE	7
NOT RECOVERED/NOT RESOLVED	4 (57.1%)
RECOVERED/RESOLVED	2 (28.6%)
RECOVERED/RESOLVED WITH SEQUELAE	0
RECOVERING/RESOLVING	1 (14.3%)
FATAL	0
UNKNOWN	0

Multiple occurrences of the same AE in an individual are counted separately. Percentages are calculated based on 'Total Number of AE' for each grouped term. Only treatment emergent adverse events are included.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023
