Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

TOPIRAMATE	1 (1.0%)

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Concomitant Medications by Medication Class and Preferred Name, Not For Cancer, Cohort C: TNBC, Intent-to-Treat Population
Protocol: CO40016

ATC Class Level 2 Therapy	Ipatasertib + Atezolizumab + Paclitaxel (N=102)

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Treatments are coded using the WHODRUG GLOBAL B3 SEPTEMBER 1, 2022. dictionary. Treatments can appear under multiple classes. The table includes medications that have temporal overlap with study drug administration. Multiple uses of a specific medication for a patient were counted once in the frequency for the medication. Likewise, multiple uses within a specific medication class for a patient were counted once in the frequency for the medication class. Use of the anti-diarrheal medication Loperamide is primarily summarized in separate outputs.

Time to Event Summary for Progression-Free Survival (Investigator), Cohort C: TNBC, Intent-to-Treat Population
Protocol: CO40016

Earliest Contributing Event to Progression Free Survival by Investigator

	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Patients with event (%)	78 (76.5%)
Earliest contributing event	
Death	6
Disease Progression	72
Patients without event (%)	24 (23.5%)
Time to Event (Months)	
Median	7.1
95% CI	(5.5, 9.1)
25% and 75%-ile	3.7 - 13.9
Range	1 - 28*
One year duration	
Patients remaining at risk	24
Event Free Rate (%)	31.17
95% CI	(21.59, 40.76)

* Censored value. ^ Censored and event.

ECG Shift Table, Cohort A: TNBC, Safety Evaluable Population
Protocol: CO40016

Assessment: ECG Interpretation

Treatment Group	Baseline	Post-Baseline Worst Value			
		Normal	Abnormal, Not Clinically Significant	Abnormal, Clinically Significant	Missing
Placebo + Paclitaxel (N=87)	Normal	30	14	0	19
	Abnormal, Not Clinically Significant	11	6	1	6
Ipatasertib + Paclitaxel (N=166)	Normal	77	18	1	29
	Abnormal, Not Clinically Significant	16	14	0	11

Table entries provide the number of patients by baseline assessment and worst post-baseline assessment. Baseline is the patient's last observation prior to initiation of study drug.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Program: root/clinical_studies/RO5532961/CDPT7890/CO40016/data_analysis/CSRFinal_Safety/prod/program/t_eg_shift.sas

NCI-CTCAE=National Cancer Institute Common Terminology Criteria for Adverse Events. Table entries provide the number of patients with the highest post-baseline NCI-CTCAE grade. "Not Low" includes Grade 0 and Grade 1-4 abnormalities in the opposite direction. Baseline is the patient's last observation prior to initiation of study drug.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

NCI-CTCAE=National Cancer Institute Common Terminology Criteria for Adverse Events. Table entries provide the number of patients with the highest post-baseline NCI-CTCAE grade. "Not Low" includes Grade 0 and Grade 1-4 abnormalities in the opposite direction. Baseline is the patient's last observation prior to initiation of study drug.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Summary Statistics of Absolute Scores and Mean Change from Baseline by Visit for EORTC QLQ-C30: Global Health Status/Quality of Life, PRO Evaluable Population, Cohort C: TNBC
Protocol: CO40016

	Ipatasertib + Atezolizumab + Paclitaxel (N=101)	
Visit	Value at Visit	Change from Baseline
Baseline		
n	101	
Mean (SD)	74.92 (21.26)	
95% CI	(70.72, 79.11)	
Median	83.33	
Min - Max	0.0 - 100.0	
Cycle 2 Day 1		
n	100	100
Mean (SD)	74.42 (19.58)	-0.42 (18.02)
95% CI	(70.53, 78.30)	(-3.99, 3.16)
Median	83.33	0.00
Min - Max	0.0 - 100.0	-50.0 - 41.7
Cycle 3 Day 1		
n	92	92
Mean (SD)	74.46 (14.97)	0.18 (18.32)
95% CI	(71.36, 77.56)	(-3.61, 3.98)
Median	75.00	0.00
Min - Max	41.7 - 100.0	-50.0 - 50.0
Cycle 4 Day 1		
n	84	84
Mean (SD)	71.83 (17.87)	-4.37 (22.83)
95% CI	(67.95, 75.70)	(-9.32, 0.59)
Median	75.00	0.00
Min - Max	0.0 - 100.0	-91.7 - 41.7

Baseline is defined as the last assessment prior to first dose of study treatment. PRO-Evaluable Population includes all randomized patients who have a baseline and at least 1 post-baseline assessment. An increase in scores from baseline indicates improvement.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Number of subjects expected to complete	20

Baseline is defined as the last assessment prior to first dose of study treatment (i.e. Baseline assessment was Cycle 1 Day 1). The EORTC QLQ-C30 should be completed on Day 1 of each cycle and at the treatment discontinuation visit unless patient discontinued treatment due to death or lost of follow-up.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

Program: root/clinical_studies/RO5532961/CDPT7890/CO40016/data_analysis/CSRFinal_Safety/prod/program/t_qs_comp.sas
Output: root/clinical_studies/RO5532961/CDPT7890/CO40016/data_analysis/CSRFinal_Safety/prod/output/t_qs_comp_C30INST_C_IT.out

Questionnaire Completion Rate by Visit for EORTC QLQ-C30 in Instrument Level, Instrument Compliance, Cohort C: TNBC, Intent-to-Treat Population
Protocol: CO40016

Visit	Ipatasertib + Atezolizumab + Paclitaxel (N=102)
Long Term Follow Up 18 Months	
All questions completed	0
At least one question completed	12 (60.0%)
Did not complete any questions	8 (40.0%)
Measure not Administered	2 (25.0%)
Other	2 (25.0%)
Missing Reason	4 (50.0%)
Long Term Follow Up 21 Months	
Number of subjects expected to complete	8

Vital Sign Results and Change from Baseline by Visit, Cohort C: TNBC, Safety Evaluable Population
Protocol: CO40016

Pulse Rate (beats/min)

Visit Analysis Timepoint	Ipatasertib + Atezolizumab + Paclitaxel (N=102) Value at Visit	Change from Baseline
PRE PAC INFUSION		
n	8	8
Mean (SD)	76.6 (9.5)	1.0 (6.3)
Median	77.5	0.0
Min - Max	60 - 87	-8 - 11
AFTER PAC INFUSION		
n	4	4
Mean (SD)	83.8 (7.3)	4.5 (7.9)
Median	81.5	4.5
Min - Max	78 - 94	-4 - 13
Cycle 27 Day 1		
PRE ATEZO INFUSION (COHORT C)		
n	8	8
Mean (SD)	74.5 (7.5)	-0.4 (6.2)
Median	72.0	0.0
Min - Max	65 - 84	-10 - 9
PRE PAC INFUSION		
n	8	8
Mean (SD)	71.3 (7.3)	-4.4 (6.4)
Median	71.0	-2.5
Min - Max	61 - 83	-14 - 2
AFTER PAC INFUSION		
n	4	4
Mean (SD)	73.8 (5.6)	-5.5 (5.4)
Median	71.5	-6.5
Min - Max	70 - 82	-11 - 2
Cycle 27 Day 8		
PRE PAC INFUSION		
n	3	3
Mean (SD)	84.0 (10.6)	4.3 (13.5)
Median	88.0	4.0
Min - Max	72 - 92	-9 - 18
AFTER PAC INFUSION		
n	3	3
Mean (SD)	85.0 (4.6)	5.3 (7.6)
Median	84.0	2.0
Min - Max	81 - 90	0 - 14
Cycle 27 Day 15		
PRE ATEZO INFUSION (COHORT C)		
n	7	7
Mean (SD)	74.4 (5.0)	-2.0 (7.9)
Median	74.0	-2.0
Min - Max	70 - 83	-12 - 13

Baseline is the patient's last observation prior to initiation of study drug.
Data Cutoff Date - 21MAR2023; Data Extraction Date - 21MAR2023

TABLE OF CONTENTS

1. NARRATIVES

1.1 NARRATIVES FOR PATIENTS WHO DIED DUE TO ADVERSE EVENT(S)

Study Number/CRTN:	CO40016/304194	Patient number	1022
Demographics:	61-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Pulmonary embolism Death due to adverse event, SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative right breast cancer (T2N2M0) approximately 5 years prior to study entry.

On Study Day −31, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER 2 status not assessed in metastatic tissue. At screening, sites of disease involvement included lymph nodes (right sub clavicular and parasternal, left axillary and mediastinal), liver (segment II and VII), right lung cachexia, bone and pleural effusion.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy	Approximately 5 years prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide, and fluorouracil (6 cycles each)	Approximately 5 years prior to study entry	Approximately 4 years and 9 months prior to study entry
Radiotherapy	Adjuvant	Chest wall (dose: 50 cGy, 25 fractions), supraclavicular lymph node (dose: 46 cGy, 25 fractions)	Approximately 4 years and 6 months prior to study entry	Approximately 4 years and 5 months prior to study entry

No medical or surgical history was reported. Concurrent conditions included obesity, hypertension, peripheral venous disease, osteoarthritis, gastritis, cholelithiasis, asthenia, pain in extremity (right arm) and peripheral swelling.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included diclofenac and moxonidine.

Event: Pulmonary embolism (thrombembolia of lung arteria)

Prior to the event of pulmonary embolism, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 25, at 13:45 hours, the patient died at home and the cause of death was reported as pulmonary embolism. No diagnostic tests were performed. She did not have any history of thrombotic events and any signs of clinical progression. No autopsy was performed.

The patient received last dose of paclitaxel on Study Day 15 and ipatasertib on Study Day 21.

The Investigator considered pulmonary embolism to be unrelated to ipatasertib and paclitaxel and related to concurrent illness.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Asthenia	3	Non-serious	8	Unresolved	Related	Related
Bone pain	3	Non-serious	8	Unresolved	Related	Related
Nausea	2	Non-serious	8	Unresolved	Related	Related
Eastern cooperative oncology group performance status worsened	2	Non-serious	8	15	Related	Related
Decreased appetite	2	Non-serious	8	Unresolved	Related	Related
Diarrhea	1	Non-serious	8	Unresolved	Related	Related
Anemia	1	Non-serious	14	Unresolved	Related	Related

Study Number/CRTN:	CO40016/304232	Patient number	1216
Demographics:	64-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Cardiopulmonary failure Death due to adverse event, SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with poorly differentiated, ER/PR and HER2 negative left breast cancer (T2N3MX; histological subtype ″other″), on Study Day –632, following left radical mastectomy.

On Study Day –48, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included bilateral ovary, left breast thoracic wall, left adrenal gland and bilateral bone (ribs, vertebral column, pelvis, and right acetabulum).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	–541	–477
Cancer therapy	Adjuvant	Paclitaxel (3 cycles)	–456	–414
Radiotherapy	Adjuvant	Chest wall and loco-regional lymph nodes (dose: 5000 cGy; 25 fractions)	–368	–336

The patient′s medical history included cerebrovascular accident. Concurrent conditions included type 2 diabetes mellitus, hypertension and hyperlipidemia.

At screening, the patient′s ECOG Performance Status was 1. Vitals showed blood pressure 137/71 mmHg, pulse rate 68 beats/min and respiratory rate 18 breaths/min. ECG was normal.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included metformin, lisinopril, lercanidipine, pentoxifylline and atorvastatin.

Event: Cardiopulmonary failure (cardiorespiratory failure)

Prior to the event of cardiopulmonary failure, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 7.

On Study Day 8, the patient was noted with Grade 2 hyperglycemia (non-serious, related to ipatasertib; glucose 10.03 mmol/L; normal range: 3.3-5.6 mmol/L) and Grade 2 neutropenia (non-serious, related to paclitaxel; neutropenia 1.3×10^9/L; normal range: 1.7-8.7 $\times 10^9$/L). She received treatment with filgrastim.

On Study Day 12, the patient died at home due to cardiopulmonary failure (details not reported). It was reported that there was no change in general health status since her last site visit on Study Day 8. No medical examination and treatment were given. An autopsy was not performed. The events of hyperglycemia and neutropenia remained unresolved at the time of patient′s death.

The last dose of paclitaxel was administered on Study Day 1 and ipatasertib on Study Day 7.

The Investigator considered cardiopulmonary failure, to be unrelated to ipatasertib and paclitaxel and related to disease under study and concurrent illness (hypertension). It was reported that the baseline conditions diabetes mellitus type 2, history of stroke 4 years ago and tobacco use could also be the suspected causes for this event.

No other events were experienced by the patient during the study.

1.2 NARRATIVES FOR PATIENTS WHO DIED DUE TO DISEASE PROGRESSION

Study Number/CRTN:	CO40016/305173	Patient number	1032
Demographics:	56-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER 2 negative left breast cancer (T2N0M0), approximately 3 years prior to study entry.

The patient was diagnosed with metastatic disease on Study Day −66 with ER/PR status unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included lung (left upper lobe and right lower lobe) and sternum.

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left lumpectomy	Approximately 2 years and 11 months prior to study entry	NA

No medical or surgical history was reported. Concurrent conditions included ischemic stroke, aortic valve incompetence and seasonal allergy.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bisoprolol and bemiparin.

On Study Day 445, a radiographic response assessment showed disease progression.

On Study Day 468, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 455 and ipatasertib given on Study Day 466. The patient entered into the long-term follow-up.

On Study Day 478, the patient died due to disease progression. An autopsy was not performed.

AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Dysgeusia	1	Non-serious	8	15	Unrelated	Related
Urinary tract infection	2	Non-serious	9	9	Unrelated	Unrelated
Alanine aminotransferase increased	1	Non-serious	29	Unresolved	Unrelated	Unrelated
Aspartate aminotransferase increased	1	Non-serious	29	Unresolved	Unrelated	Unrelated
Diarrhea	2	Non-serious	35	307	Related	Unrelated
Extrasystoles	2	Non-serious	57	Unresolved	Unrelated	Unrelated
Asthenia	3	Non-serious	70	Unresolved	Related	Related
Dyspepsia	1	Non-serious	70	Unresolved	Related	Related
Neuropathy peripheral	2	Non-serious	197	308	Unrelated	Related
Dermatitis	2	Non-serious	239	Unresolved	Related	Related
Diarrhea	2	Non-serious	337	339	Related	Unrelated
Neuropathy peripheral	3	Non-serious	337	Unresolved	Unrelated	Related
Oropharyngeal pain	1	Non-serious	375	393	Unrelated	Unrelated
Diarrhea	2	Non-serious	375	478	Related	Unrelated
Dizziness	1	Non-serious	428	448	Unrelated	Unrelated

Study Number/CRTN:	CO40016/320127	Patient number	1122
Demographics:	37-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was diagnosed with moderately differentiated, ER/PR and HER 2 negative metastatic left breast cancer (T4N3M1; histological grade not otherwise specified) on Study Day −53. At screening, sites of disease involvement included right breast tumor, lymph nodes (bilateral axillary and bilateral sub-supraclavicular) and multiple lesions in lung.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included anemia, gallbladder obstruction, left breast pain, asthenia, lymphostasis (left upper extremity) and pain in extremity (left arm).

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included ascorbic acid/ferrous sulfate, omeprazole, and ketorolac.

On Study Day 72, the patient showed symptomatic deterioration (pain in right breast).

On the same day (Study Day 72), study treatment with ipatasertib and paclitaxel was permanently discontinued due to symptomatic deterioration with the last dose of paclitaxel given on Study Day 64 and ipatasertib on Study Day 71. The patient entered into the long-term follow-up.

On Study Day 81, the patient died due to disease progression. It was unknown whether an autopsy was performed.

AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	7	9	Related	Unrelated
Alanine aminotransferase increased	1	Non-serious	29	Unresolved	Related	Related
Aspartate aminotransferase increased	1	Non-serious	29	Unresolved	Related	Related
Hypoalbuminemia	1	Non-serious	29	Unresolved	Unrelated	Unrelated
Erysipelas	2	Non-serious	53	72	Unrelated	Unrelated
Leukocytosis	1	Non-serious	57	71	Related	Related

Study Number/CRTN:	CO40016/318262	Patient number	1146
Demographics:	28-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative right breast cancer (T2N3M1), on Study Day −35.

On Study Day −28, metastatic disease was confirmed with ER/PR unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included lymph node (mediastinal and right axillary), liver (segment VII), right breast and multiple bone metastasis.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included back pain and breast pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included magnesium oxide, paracetamol/tramadol, and oxycodone.

On Study Day 46, the patient showed symptomatic deterioration (back pain).

On Study Day 54, study treatment with ipatasertib and paclitaxel was permanently discontinued due to symptomatic deterioration with the last dose of paclitaxel given on Study Day 43 and ipatasertib on Study Day 49. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in the table below:

Treatments	**Start Day**	**Stop Day**
Gemcitabine and cisplatin (1 cycle each)	54	54

On Study Day 55, the patient died due to disease progression. An autopsy was not performed.

AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Diarrhea	1	Non-serious	2	49	Related	Unrelated
Peripheral sensory neuropathy	1	Non-serious	6	Unresolved	Unrelated	Related
Insomnia	1	Non-serious	14	Unresolved	Unrelated	Unrelated
Stomatitis	2	Non-serious	25	43	Unrelated	Related
Alopecia	1	Non-serious	25	Unresolved	Unrelated	Related
Decreased appetite	2	Non-serious	30	Unresolved	Related	Related
Nausea	3	Non-serious	30	Resolving	Related	Related
Vomiting	3	Non-serious	30	36	Related	Related
Fatigue	2	Non-serious	30	Unresolved	Related	Related
Constipation	1	Non-serious	50	Unresolved	Unrelated	Unrelated
Hypocalcemia	1	Non-serious	52	52	Unrelated	Unrelated

Study Number/CRTN:	CO40016/318135	Patient number	1215
Demographics:	47-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1(PT) Category:	Diarrhea SAE		
Event 2 (PT) Category:	Pleural effusion SAE		
Event 3 (PT) Category:	Diarrhea SAE		
Additional category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER positive, PR and HER 2 negative left breast cancer (T1N2M0) on Study Day −706.

On Study Day −32, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease. At screening, sites of disease involvement included right ventricular outflow and mid ventricular lymph node.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Docetaxel and doxorubicin (4 cycles each)	−639	−492
Surgery	Curative	Left simple mastectomy	−310	NA
Radiotherapy	Other	Left breast (dose unknown; 15 fractions)	−273	−262

No medical or surgical history was reported. Concurrent conditions included hypothyroidism and diabetes mellitus.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 2 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included metformin and levothyroxine.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 9 and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient experienced general weakness, Grade 1 dry cough (non-serious, related) and Grade 1 (initial intensity) diarrhea. On Study Day 15, event of diarrhea worsened to Grade 2, and she was hospitalized for further evaluation. Chest X-ray and stool test was done (results not reported). She received treatment with racecadotril, loperamide, cefoperazone/sulbactam, amikacin, pantoprazole, ondansetron, *Saccharomyces boulardii*, megestrol, cefixime/ornidazole, esomeprazole, lactulose for diarrhea and acetylcysteine for dry cough. On Study Day 19, the events of diarrhea and dry cough were considered resolved and she was discharged from the hospital.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of Diarrhea	6	PO	1	8
Diarrhea	2	PO	9	11
Diarrhea	6	PO	12	15
Prophylaxis of Diarrhea	2	PO	19	24
Prophylaxis of Diarrhea	2	PO	31	38
Prophylaxis of Diarrhea	2	PO	59	80

Due to this event, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 16 and the next dose was given at a reduced dose of 300 mg on Study Day 19.

The Investigator considered diarrhea to be unrelated to paclitaxel and related to ipatasertib and other causes (unspecified).

Event 2: Pleural effusion

Prior to the event of pleural effusion, the most recent dose of paclitaxel was administered on Study Day 73 and ipatasertib (300 mg) on Study Day 80.

On Study Day 87, the patient experienced shortness of breath. Chest X-ray was performed, and she was diagnosed with Grade 3 pleural effusion, leading to hospitalization. Pleural tapping was performed. She received treatment with pheniramine. On Study Day 89, a radiographic

response assessment (CT) showed partial response. On Study Day 94, the event of pleural effusion was considered resolved and she was discharged from the hospital.

Due to this event, Cycle 4 Day 1 dose of paclitaxel was not administered and study treatment with ipatasertib was interrupted on Study Day 87. The next dose of paclitaxel and ipatasertib was administered on Study Day 94.

The Investigator considered pleural effusion to be unrelated to ipatasertib and paclitaxel and related to other causes unspecified.

Event 3: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 101 and ipatasertib (300 mg) on Study Day 105.

On Study Day 106, the patient experienced vomiting, second episode of Grade 1 (initial intensity) diarrhea. On Study Day 108, the event of diarrhea worsened to Grade 2 (diffuse loose stools), leading to hospitalization. Upon admission, her ECOG performance status was 2. She also complained of pain in chest wall. Study treatment with ipatasertib and paclitaxel was interrupted, and supportive care was started. She received prophylactic treatment with megestrol, ursodeoxycholic acid, paracetamol/tramadol, *Saccharomyces boulardii,* buprenorphine, ascorbic acid/cyanocobalamin/folic acid/nicotinic acid/pantothenic acid/pyridoxine/riboflavin/thiamine/zinc sulfate, pantoprazole, cefoperazone/sulbactam, ipratropium/levosalbutamol, diclofenac, gabapentin/nortriptyline, paracetamol, tramadol, ofloxacin, paracetamol, budesonide/formoterol and fusidic acid. She also received palliative radiation therapy for the pain in the chest (details in the table below) which was well tolerated. Later, during hospitalization, she was shifted to the HDU unit due to anxiety and tachycardia (heart rate not reported). It was reported that she was conscious, oriented and afebrile. Breast ultrasound was performed (results not reported). On Study Day 112, the event of diarrhea was considered resolved; however, hospitalization was continued. On Study Day 121, she was discharged from the hospital.

The patient received on-study anti-cancer therapy as listed in table below:

Treatment	Start Day	Stop Day
Radiotherapy to skin (left chest wall skin; dose: 102 cGy; 3 fractions)	110	112

Due to the event of diarrhea, study treatment with paclitaxel was interrupted after Study Day 101 and ipatasertib after Study Day 107.

The Investigator considered diarrhea to be unrelated to paclitaxel and related to ipatasertib and other causes unspecified.

On Study Day 114, a radiographic assessment showed disease progression with new lesions in bone (multiple sclerotic lesions), liver (hepatomegaly with multiple focal lesions in liver), brain (mild linear continuous pachymeningeal enhancement seen along cerebral convexities on both sides) and right breast (multiple enlarged right axillary nodes with increased soft tissue thickening).

On Study Day 114, study treatment with paclitaxel and ipatasertib was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 101 and ipatasertib on Study Day 107. The patient entered into the long-term follow-up.

On Study Day 121, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Neutropenia	2	Non-serious	16	17	Unrelated	Unrelated
Anemia	3	Non-serious	17	30	Unrelated	Unrelated
Pain	1	Non-serious	57	59	Unrelated	Unrelated

1.3 NARRATIVES FOR PATIENTS WHO EXPERIENCED SERIOUS ADVERSE EVENT(S)

Study Number/CRTN:	CO40016/304778	Patient number	1003
Demographics:	76-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	Pneumonia SAE, AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Hyperglycemia Grade ≥ 3 Hyperglycemia		
Event 3 (PT) Category:	Glucose tolerance impaired Grade ≥ 3 Hyperglycemia		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER negative, PR positive and HER 2 negative left breast cancer (T2N0M0), on Study Day −782, followed by simple mastectomy.

On Study Day −51, the patient was diagnosed with metastatic disease with ER/PR negative, HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included segment 8 of liver.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Cyclophosphamide, methotrexate, and fluorouracil (8 cycles each)	−740	−566
Radiotherapy	Adjuvant	Left chest wall (dose: 4600 cGy, 23 fraction)	−685	−652
Radiotherapy	Adjuvant	Left internal mammary (dose: 5600 cGy, 28 fraction)	−685	−645
Cancer therapy	Adjuvant	Letrozole	−545	−26

The patient's medical history included lower limb fracture (right knee) and cough. Surgical history included medical device implantation (nail fixation). Concurrent conditions included insomnia, hypertension, endometrial thickening, hepatic steatosis, osteoporosis, and *Helicobacter* gastritis.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included atenolol, losartan, amlodipine, and lansoprazole.

Event 1: Pneumonia
Event 2: Hyperglycemia (Hyperglycemia after S/P steroid)
Event 3: Glucose tolerance impaired (Glucose intolerance)

Prior to the events of pneumonia, hyperglycemia, and glucose tolerance impaired, the most recent dose of ipatasertib (400 mg) was administered on Study Day 48 and paclitaxel on Study Day 49.

On Study Day 56, the patient experienced Grade 1 fever (body temperature: 38.9°C) without chills. A laboratory work-showed WBC count 3.21 $\times$ $10^3/\mu L$ (normal range: 3.2-9 $\times$ $10^3/\mu L$),

neutrophil count 2.340 $\times$ $10^3/\mu L$ (normal range: 1.28-6.75 $\times$ $10^3/\mu L$), C-reactive protein 11.98 mg/dL (normal range: $<$ 0.5 mg/dL) and glucose 163 mg/dL (normal range: 70-100 mg/dL). She was diagnosed with Grade 2 hyperglycemia (non-serious, related to ipatasertib). On the same day (Study Day 56), she was hospitalized. On Study Day 57, a chest CT-scan showed bilateral lung inflammation and suspected pulmonary embolism. The results were also suggestive of infection (suspected by *Pneumocystis jirovecii* and Cytomegalovirus). Subsequently, she was diagnosed with serious Grade 3 pneumonia.

On Study Day 58, she was noted with non-serious Grade 3 glucose tolerance impaired. On Study Day 59, she was reported with non-serious Grade 3 hyperglycemia which was assessed as unrelated to ipatasertib. She received treatment with ceftazidime, amoxicillin/clavulanic acid, paracetamol, azithromycin, methylprednisolone, and sulfamethoxazole/trimethoprim for the event of pneumonia, insulin, metformin and pioglitazone for glucose tolerance impaired and hyperglycemia. On Study Day 79, the event of pneumonia was considered resolved. On Study Day 80, the events of glucose tolerance impaired and hyperglycemia (Grade 2 and Grade 3) were considered resolved. No information regarding discharge was reported.

Relevant lab values are listed in the table below:

Study Day	**Glucose** (normal range: 70-100 mg/dL)	**HbA1c** (normal range: 4-6%)
Screening	126	6.4
56	163	9.3
59	305	–
80	116	7

Due to the event of pneumonia, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 79 with the last dose of ipatasertib given on Study Day 48 and paclitaxel on Study Day 49. The patient entered into the long-term follow-up.

Action taken with study treatment due to the events of hyperglycemia and glucose tolerance impaired was reported as not applicable.

The Investigator considered pneumonia to be unrelated to ipatasertib and paclitaxel and related to other unspecified causes.

The Investigator considered hyperglycemia (Grade 3) and glucose tolerance impaired to be unrelated to ipatasertib and paclitaxel and related to concomitant medication (steroid treatment given for pneumonia).

On Study Day 162, a radiographic response assessment showed disease progression.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel (12 cycles)	185	262
Paclitaxel (12 cycles)	441	521
Doxorubicin (4 cycles)	731	794
Capecitabine (15 cycles)	815	1039
Vinorelbine (unknown cycles)	1102	Ongoing

On Study Day 1356, the patient was permanently discontinued from the study as the study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Decreased appetite	2	Non-serious	4	97	Unrelated	Related

Study Number/CRTN:	CO40016/304878	Patient number	1005
Demographics:	59-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade $\geq$ 3 hepatotoxicity		
Event 2 (PT) Category:	Aspartate aminotransferase increased Grade $\geq$ 3 hepatotoxicity		
Event 3 (PT) Category:	Fracture SAE		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR negative, HER 2 negative left breast cancer (T2N3cM1) on Study Day −37. At screening, sites of disease involvement included left breast and left paraaortic lymph node.

No past cancer treatments were reported.

The patient′s medical history included left breast inflammation and headache. No surgical history was reported. Concurrent condition included osteoporosis.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

Event 1: Alanine aminotransferase increased (ALT increased)
Event 2: Aspartate aminotransferase increased (AST increased)

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 379 and ipatasertib (400 mg) on Study Day 385.

On Study Day 393, a scheduled laboratory work-up showed ALT 318 U/L (normal range: 0-40 U/L) and AST 254 U/L (normal range: 0-40 U/L). The patient was diagnosed with non-serious Grade 3 **alanine aminotransferase increased,** and **aspartate aminotransferase increased**. She received treatment with *Silybin marianum* and adenine hydrochloride/bifendate/carnitine orotate/cyanocobalamin/liver extract/pyridoxine/riboflavin. On Study Day 399, the event of alanine aminotransferase increased was considered resolved. On Study Day 400, the event of aspartate aminotransferase increased improved to Grade 2. On Study Day 406, the event of aspartate aminotransferase increased was considered resolved.

Relevant lab values are listed in the table below:

Study Day	**AST** (normal range: 0-40 U/L)	**ALT** (normal range: 0-40 U/L)	**Total bilirubin** (normal range: 0.2-1.2 mg/dL)	**ALP** (normal range: 40-120 U/L)
Screening	22	22	0.2	97
365	21	18	0.3	69
393	254	318	0.6	258
400	137	71	1.5	402
407	62	30	0.6	226

Due to the events of alanine aminotransferase increased and aspartate aminotransferase increased, Cycle 15 Day 1 and Cycle 15 Day 8 of paclitaxel were not administered and study treatment with ipatasertib was interrupted on Study Day 393. The next dose of paclitaxel (at a reduced dose of 65 mg/m^2) and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 407.

The Investigator considered alanine aminotransferase increased and aspartate aminotransferase increased to be related to ipatasertib and paclitaxel.

Event 3: Fracture

Prior to the event of fracture, the most recent dose of paclitaxel was administered on Study Day 645 and ipatasertib (300 mg) on Study Day 646.

On Study Day 645, the patient experienced Grade 2 back pain (non-serious, unrelated) and visited the local hospital. An X-ray was performed, and fracture was suspected. On Study Day 647, she presented to the emergency room due to ongoing back pain. An MRI of whole spine revealed acute benign Grade 3 compression **fracture** at T8, leading to hospitalization for supportive care. The bone densitometry showed spine anteroposterior bone mass density (L1-L2) 0.605 g/cm^2 (55% of young normal; T-score -4.1), femur (neck) bone mass density 0.632 g/cm^2 (67% of young normal; T-score -2.6), femur (troch) bone mass density 0.513 g/cm^2 (70% of young normal; T-score -2.0) and femur (total) bone mass density 0.672 g/cm^2 (69% of young normal; T-score -2.5). She received treatment with denosumab and tramadol. She was on bed-rest and her condition was observed. She further received treatment with calcium carbonate/cholecalciferol. On Study Day 659, a repeat X-ray showed more collapsed compression fracture at T8, along with osteopenia. On Study Day 668, the event of back pain improved to Grade 1, and fracture improved to Grade 2. On Study Day 674, digital X-ray radiogrammetry (T-spine; anteroposterior lateral view) results were consistent with pervious X-ray (done on Study Day 659). It was reported that the pain was improving and repeated X-rays did not show worsening. On Study Day 687, the event of fracture was considered resolved and she was discharged from the hospital. The event of back pain remained unresolved at the time of study discontinuation.

Due to the event of fracture, there was no change in the study treatment with ipatasertib; however, Cycle 24 Day 8 was interrupted, and Cycle 24 Day 15 of paclitaxel was delayed and was given on Study Day 668.

The Investigator considered fracture to be unrelated to ipatasertib and paclitaxel and related to concurrent illness (osteoporosis).

On Study Day 841, the patient was discontinued from the study treatment as per physician's decision with the last dose of ipatasertib given on Study Day 833 and paclitaxel on Study Day 827. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Left breast surgery	855	NA
Radiotherapy to left breast + supraclavicular lymph node (dose: 5290 cGy, 23 fractions)	903	932

On Study Day 1342, the patient was permanently discontinued from the study as the study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304878	Patient number	1015
Demographics:	55-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Neutropenia SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR negative and HER 2 negative (histological grade unknown) left breast cancer (T2N1M0), on Study Day –635.

The patient was diagnosed with metastatic disease on Study Day −72 with ER/PR status unknown and HER 2 status not assessed in metastatic tissue. At screening, sites of disease involvement included left axillary and supraclavicular lymph node

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Date
Cancer therapy	Neoadjuvant	Cyclophosphamide, doxorubicin and unknown taxane (4 cycles each)	−631	−485
Surgery	Curative	Left simple mastectomy and sentinel lymph node biopsy	−450	NA
Radiotherapy	Adjuvant	Left breast (dose unknown)	−399	−368

No medical or surgical history and concurrent conditions were reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

On Study Day 15, the patient was noted with Grade 3 neutropenia (non-serious, related; WBC count $1.9 \times 10^3/\mu L$; normal range: 4-10 $\times 10^3/\mu L$ and neutrophils 39.8%; normal range: 50-75%). She received treatment with filgrastim. On Study Day 21, the event of neutropenia was considered resolved.

On Study Day 29, the patient was noted with second episode of Grade 3 neutropenia (non-serious, related; WBC count $2.1 \times 10^3/\mu L$; normal range: 4-10 $\times 10^3/\mu L$ and neutrophils 39.8%, normal range: 50-75%). She received treatment with lenograstim. On the same day (On Study Day 29), the event of neutropenia was considered resolved. Due to this event study treatment with paclitaxel was reduced to 65 mg/m^2 and ipatasertib to 300 mg on Study Day 30.

Event Neutropenia

Prior to the event of neutropenia, the most recent dose of paclitaxel was administered on Study Day 30 and ipatasertib (300 mg) on Study Day 36.

On Study Day 37, the patient was noted with medically significant Grade 4 neutropenia (WBC count $1.3 \times 10^3/\mu L$; normal range: 4-10 $\times 10^3/\mu L$ and neutrophils 13.4%; normal range: 50-75%). She received treatment with filgrastim. On Study Day 42, the event of neutropenia was considered resolved.

Relevant lab values are listed in the table below:

Study Day	**WBC count** (normal range: 4-10 $\times$ $10^3/\mu L$)	**Neutrophils** (normal range: 50-75 %)
Screening	4.2	63.7
8	3.9	54
15	1.9	39.8
21	2.4	34
22	10.2	72
29	2.1	39.8
30	3.5	54
37	1.3	13.4
43	5.1	58.8

Due to this event, study treatment with ipatasertib was interrupted on Study Day 37 and the next dose was given at a reduced dose of 200 mg on Study Day 43; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 30.

The Investigator considered neutropenia to be related to ipatasertib and paclitaxel.

On Study Day 106, a radiographic response assessment showed disease progression with new nodule in right lung.

On Study Day 111, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 105. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Methotrexate, fluorouracil and cyclophosphamide (5 cycles each)	114	239
Eribulin (2 cycles)	262	288
Doxorubicin and cyclophosphamide (2 cycles each)	345	366
Vinorelbine and gemcitabine (1 cycle each)	407	407
Radiotherapy (breast and supraclavicular lymph node, dose: 1560 cGy, 3 fractions)	420	422
Methotrexate (1 cycle)	423	423

On Study Day 436, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	3	4	Related	Unrelated

Study Number/CRTN:	CO40016/304194	Patient number	1022
Demographics:	61-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Pulmonary embolism Death due to adverse event, SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/304787	Patient number	1028
Demographics:	65-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Hyperglycemia Grade $\geq$ 3 hyperglycemia		
Event 2 (PT) Categories:	Hyperglycemia SAE, Grade $\geq$ 3 hyperglycemia		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, ER/PR and HER 2 negative, locally advanced unresectable, metastatic left breast cancer (T4bN2M1; histological grade unknown) on Study Day −73.

At screening, sites of disease involvement included left breast, lung (bilateral parenchyma, right pleura and right lung base), liver (segments VIII and III and hepatic parenchyma), left axillary lymph node, bone (skull and sternum) and left adrenal gland.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included diabetes mellitus and hypertension.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included glibenclamide.

Event 1: Hyperglycemia (Asymptomatic fasting hyperglycemia)

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 29 and ipatasertib (400 mg) on Study Day 33.

On Study Day 34, the patient was noted with asymptomatic non-serious Grade 3 fasting hyperglycemia (glucose 259 mg/dL; normal range: 70-99 mg/dL). No additional treatment was given for the event; however, from Study Day 37, glibenclamide 5 mg QD was increased to 5 mg BID. On Study Day 39, the event of hyperglycemia was considered resolved.

Due to this event, there was no change in the study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 36 and the next dose was given on Study Day 40.

The Investigator considered hyperglycemia to be related to paclitaxel and ipatasertib.

On Study Day 66, the patient was noted with Grade 2 hyperglycemia (non-serious; related, glucose on Study Day 69: 215 mg/dL; normal range: 70-99 mg/dL). No treatment was given for the event; however, on the same day (Study Day 66), dose of ipatasertib was reduced to 300 mg. Further, study treatment with ipatasertib was interrupted from Study Day 70 to Study Day 83 due to this event. On Study Day 77, the event of hyperglycemia was considered resolved.

Event 2: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 78 and ipatasertib (300 mg) on Study Day 91.

On Study Day 92, at 12:30 hours, during a scheduled visit, the patient was noted with Grade 4 hyperglycemia (non-fasting glucose: 558 mg/dL, normal range not reported), leading to hospitalization. She received treatment with insulin for hyperglycemia. It was reported that she was also referred to the nutritionist for dietary advice since she had a history of associated diabetes mellitus. She responded well to the insulin treatment and on Study Day 93, the event of hyperglycemia was considered resolved. On the same day (Study Day 93), she was discharged from the hospital.

Hyperglycemia treatment details:

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Insulin	Hyperglycemia	—	SC	Unknown	92	93

Relevant lab values are listed in the table below:

Study Day	Glucose (normal range: 70-99 mg/dL)
Screening	128
34	259
41	92
69	215
77	151
83	140
92	558*
93	85*
98	177

*Normal range: not reported

Due to this event, study treatment with paclitaxel was interrupted after Study Day 78 and ipatasertib after Study Day 92.

On Study Day 120, symptomatic response assessment showed clinical progression with a decline in performance status (ECOG status 3) and study treatment with ipatasertib and paclitaxel was permanently discontinued with the last dose of paclitaxel administered on Study Day 78 and ipatasertib on Study Day 92. The patient entered into the long-term follow-up.

On the same day (Study Day 120), the patient withdrew consent from the study.

The Investigator considered hyperglycemia to be unrelated to paclitaxel and related to ipatasertib and other causes (unspecified).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/304878	Patient number	1040
Demographics:	31-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Febrile neutropenia SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER 2 negative left breast cancer (T2N0M0), approximately 3 years and 10 months prior to study entry.

The patient was diagnosed with metastatic disease on Study Day –47 with ER/PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included left chest wall, lymph nodes (right hilar and left interlobar) and sternum.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left lumpectomy and sentinel lymph node biopsy	Approximately 3 years and 9 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 3 years and 8 months prior to study entry	Approximately 3 years and 6 months prior to study entry
Radiotherapy	Adjuvant	Left breast (dose: 5000 cGy, 25 fractions)	Approximately 3 years and 5 months prior to study entry	Approximately 3 years and 4 months prior to study entry
Radiotherapy	Adjuvant	Tumor bed boost (dose: 1600 cGy, 8 fractions)	Approximately 3 years and 4 months prior to study entry	Approximately 3 years and 4 months prior to study entry

No medical or surgical history was reported. Concurrent conditions included hyperthyroidism and cough.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included ranitidine and thiamazole.

On Study Day 199, the patient was noted with Grade 3 neutrophil count decreased (non-serious, related) with neutrophils 21.2% (normal range: 50-75%). She received treatment with filgrastim. On Study Day 200, the event of neutrophil count decreased was considered resolved.

Event: Febrile neutropenia

Prior to the event of febrile neutropenia, the most recent dose of paclitaxel was administered on Study Day 206 and ipatasertib (400 mg) on Study Day 208.

On Study Day 209, the patient′s body temperature was above 38°C. A laboratory work-up showed WBC count 1.8×10^3/L (normal range: 4-10 $\times 10^3/\mu$L), absolute neutrophil count 800 /μL and C-reactive protein 16.75 mg/dL (normal range not reported for both). She was diagnosed with Grade 3 febrile neutropenia, leading to hospitalization. She received treatment with filgrastim and piperacillin. On Study Day 210, test for influenza A and B virus and nasopharyngeal swab was negative. On Study Day 211, the event of febrile neutropenia was considered resolved and she was discharged from the hospital.

Relevant lab values are listed in the table below:

Study Day	**WBC count** (normal range: 4-10 $\times 10^3/\mu L$)	**Neutrophils** (normal range: 50-75%)
Screening	4.5	56.6
200	13	78.3
209	1.8	800*
210	4.2	2740*
211	10.1	7500*

*Units: /μL, normal range not reported

Due to this event, study treatment with paclitaxel was reduced to 65 mg/m^2 on Study Day 214 and ipatasertib was initially interrupted on Study Day 210 and resumed at a reduced dose of 300 mg on Study Day 214.

The Investigator considered febrile neutropenia to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 392, a radiographic response assessment showed disease progression with multiple new lesions in brain.

On Study Day 396, study treatment with paclitaxel and ipatasertib was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 382 and ipatasertib on Study Day 386. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Radiotherapy (Whole brain; dose: 4000 cGy, 10 fractions)	400	413
Capecitabine (3 cycles)	445	500
Gemcitabine and cisplatin (2 cycles each)	511	533
Eribulin (4 cycles)	563	682
Brain surgery	570	NA
Brain surgery	648	NA
Brain (tumor related orthopedic surgical intervention)	728	NA
Brain surgery	743	NA

On Study Day 761, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/306203	Patient number	1047
Demographics:	70-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Category:	Abscess jaw SAE		

The patient was randomized on Study Day −2.

The patient was initially diagnosed with lobular, ER/PR positive and HER 2 negative left breast cancer (T2N3aM0; histological grade unknown), approximately 10 years prior to study entry.

On Study Day −54, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included bone (right anterior 5th rib, midline vertebral body L2 and L4 and posterior left iliac bone).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left radical mastectomy	Approximately 10 years prior to study entry	NA
Radiotherapy	Adjuvant	Left breast (reconstructed chest wall, axillary bed and left supraclavicular fossa) (dose: 5280 cGy, 36 fractions)	Approximately 9 years prior to study entry	Approximately 9 years prior to study entry
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 9 years prior to study entry	Approximately 9 years prior to study entry
Cancer therapy	Adjuvant	Paclitaxel (12 cycles)	Approximately 9 years prior to study entry	Approximately 9 years prior to study entry
Cancer therapy	Adjuvant	Anastrozole (96 cycles)	Approximately 9 years prior to study entry	−33

No medical/surgical history was reported. Concurrent conditions included sinus tachycardia, hyperlipidemia, osteoporosis, and hypothyroidism.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included atenolol, simvastatin, levothyroxine, acetylsalicylic acid, calcium carbonate and cholecalciferol.

On Study Day 8, study treatment with ipatasertib was interrupted and the patient was started on metformin for Grade 2 hyperglycemia (non-serious, related to ipatasertib, onset day: Study Day 7 and resolution day: Study Day 11).

Event 1: Alanine aminotransferase increased (ALT increased)
Event 2: Aspartate aminotransferase increased (AST increased)

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of ipatasertib (400 mg) was administered on Study Day 7 and paclitaxel on Study Day 8.

On Study Day 14, a laboratory work-up showed ALT 313 U/L (normal range: 13-56 U/L), AST 279 U/L (normal range: 13-35 U/L) and ALP 315 U/L (normal range: 45-117 U/L) and the patient was diagnosed with Grade 3 alanine aminotransferase increased, Grade 3 aspartate aminotransferase increased and Grade 2 blood alkaline phosphatase increased (non-serious, related to paclitaxel). She had no other symptoms, and skin was normal. Ongoing treatment with metformin stopped. No treatment was reported these events. On Study Day 20, the event of aspartate aminotransferase increased was considered resolved. On Study Day 28, the events of alanine aminotransferase increased, and blood alkaline phosphatase increased were considered resolved.

Relevant lab values are listed in the table below:

Study Day	**AST** (normal range: 13-35 U/L)	**ALT** (normal range: 13-56 U/L)	**ALP** (normal range: 45-117 U/L)	**Bilirubin** (normal range: 0.2-1.3 mg/dL)
Screening	20	22	71	0.4
7	16	31	60	0.7
14	279	313	315	0.4
27	22	40	104	0.5
34	18	32	96	0.5

Due to the events of alanine aminotransferase increased and aspartate aminotransferase increased, study treatment with paclitaxel (Cycle 1 Day 15) was interrupted and ipatasertib interruption was prolonged. The next dose of paclitaxel and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 28.

The Investigator considered alanine aminotransferase increased to be unrelated to ipatasertib and paclitaxel and related to concomitant medication (metformin).

The Investigator considered aspartate aminotransferase increased to be unrelated to ipatasertib and related to paclitaxel and concomitant medication (metformin).

Event 3: Abscess jaw (Right mandibula abscess)

Prior to the event of abscess jaw, the most recent dose of ipatasertib (300 mg) was administered on Study Day 1126 and paclitaxel on Study Day 1148.

On Study Day 1161, the patient presented to hospital with redness on right cheek and spontaneous purulent discharge. A superficial wound culture and a CT scan of mandible was performed, and the patient was diagnosed with Grade 3 right mandibular abscess (preferred term: abscess jaw), leading to hospitalization**.** She was treated with levofloxacin. On Study Day 1166, the event of abscess jaw was considered resolved with sequelae (unspecified) and the patient was discharged from the hospital.

Due to the event of abscess jaw, study treatment with paclitaxel and ipatasertib was interrupted and later on Study Day 1161, study treatment with paclitaxel and ipatasertib and study was permanently discontinued as she enters post-trial access program with the last dose of ipatasertib administered on Study Day 1126 and paclitaxel given on Study Day 1148.

The Investigator considered abscess jaw to be unrelated to ipatasertib and paclitaxel and related to disease under study.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	2	Non-serious	4	11	Related	Unrelated

Study Number/CRTN:	CO40016/304776	Patient number	1070
Demographics:	66-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Febrile neutropenia SAE		
Event 2 (PT) Categories:	Rash AE leading to study treatment discontinuation, Grade $\geq$ 3 rash		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR negative and HER 2 negative right breast cancer (T2N0M0; histological grade unknown) on Study Day -982.

On Study Day -51, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER2 status not assessed in metastatic tissue. At screening, sites of disease involvement included liver, left kidney (adrenal nodule), bilateral lung (numerous varying-sized nodules in bilateral lungs) and bone (sternoclavicular joint).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Afatinib (cycles unknown) and paclitaxel (3 cycles)	-962	-889
Surgery	Curative	Right partial mastectomy	-863	NA
Cancer therapy	Adjuvant	Cyclophosphamide and epirubicin (4 cycles each)	-850	-787
Radiotherapy	Adjuvant	Right breast (dose: 5000 cGy, 25 fractions)	-632	-596

Radiotherapy	Adjuvant	Breast tumor bed (1000 cGy, 5 fractions)	-595	-589

The patient′s medical history included hypoesthesia, pain in extremity and chronic lymphocytic leukemia. Surgical history included central venous catheterization. Concurrent conditions included hypertension, viral hepatitis carrier, hyperlipidemia, functional gastrointestinal disorder, myofascial pain syndrome and palpitations.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included atorvastatin, olmesartan and amlodipine.

Event 1: Febrile neutropenia

Prior to the event of febrile neutropenia, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 17.

On Study Day 9, the patient experienced Grade 2 mucosal inflammation (non-serious, related to paclitaxel). On Study Day 15, she was noted with Grade 2 white blood cell count decreased (non-serious, related to paclitaxel) with WBC count at 2.63 x $10^3/\mu L$ (normal range: 3.54-9.06 $\times$ $10^3/\mu L$).

On Study Day 18, she experienced fever (body temperature 37.8°C), chills and was noted to have Grade 3 hypotension (non-serious, unrelated; blood pressure 63/35 mmHg). A laboratory work-up showed WBC count 0.59 x $10^3/\mu L$ (normal range: 3.54-9.06 x $10^3/\mu L$), neutrophils 31.0 % (normal range: 38.3-71.1 %) and CRP 16.07 mg/dL (normal range not reported). She was diagnosed with Grade 3 febrile neutropenia. Blood culture was performed (returned positive on Study Day 21 for *Clostridium sordellii*). Urine culture was also performed (result not reported) and urine tests revealed albumin/creatinine 80 mg/g (1+). She received treatment with paracetamol for fever, norepinephrine for hypotension, nystatin, triamcinolone and benzydamine for mucosal inflammation and cefepime, filgrastim, metronidazole, oseltamivir for febrile neutropenia. On the same day (Study Day 18), her body temperature returned to normal (body temperature 36.5°C) and also the event of hypotension was considered resolved (blood pressure 107/67 mmHg). On Study Day 19, she was hospitalized for further evaluation. Relevant laboratory values are reported in the table below. On Study Day 20, the event of white blood cell count decreased was considered resolved. She further received treatment with amoxicillin/clavulanic acid for febrile neutropenia and paracetamol for mucosal inflammation. On Study Day 24, the event of febrile neutropenia was considered resolved and the patient was discharged from the hospital. On Study Day 79, the event of mucosal inflammation was considered resolved.

Relevant lab values are listed in the table below:

Study Day	**WBC count** (normal range: 3.54-9.06 $\times$ $10^3/\mu L$)	**Neutrophils** (normal range: 38.3-71.1 %)
Screening	6.58	71.3
15	2.63	64
18	0.59	31.0
21	3.89	53.3
29	7.78	73.3

There was no change in study treatment due to this event.

The Investigator considered febrile neutropenia to be related to paclitaxel and unrelated to ipatasertib.

Event 2: Rash (skin rash)

Prior to the event of rash, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 24, the patient experienced non-serious Grade 1 (initial intensity) rash (site unspecified). On Study Day 26, the event of rash worsened to Grade 3. She received treatment with levocetirizine, betamethasone, buclizine, clobetasol, prednisolone and tetracycline for the event. On Study Day 44, the event improved to Grade 1. On Study Day 169, the event of rash was considered resolved.

Due to this event, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 42 with the last dose of paclitaxel administered on Study Day 30 and ipatasertib administered on Study Day 36. The patient entered into the long-term follow-up.

The Investigator considered rash to be unrelated to paclitaxel and related to ipatasertib and concomitant medication (unspecified).

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Vinorelbine and capecitabine (1 cycle)	58	149
Eribulin	169	Ongoing

On Study Day 1047, the patient was permanently discontinued from the study as per physician's decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	9	24	Related	Unrelated
Abdominal pain	1	Non-serious	19	19	Related	Unrelated
Anxiety	2	Non-serious	19	23	Unrelated	Unrelated
Decreased appetite	2	Non-serious	19	24	Unrelated	Unrelated
Electrolyte imbalance	2	Non-serious	21	23	Unrelated	Unrelated
Anemia	2	Non-serious	21	28	Unrelated	Unrelated
Arthralgia	2	Non-serious	21	24	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304332	Patient number	1072
Demographics:	58-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Schwannoma SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with pathological, ER/PR negative and HER2 negative right breast cancer (T3N1M0), approximately 17 years prior to study entry.

The patient was diagnosed with metastatic disease approximately 12 years prior to study entry with ER /PR negative and HER2 negative disease with soft tissue, breast mussel in metastatic tissue. At screening, sites of disease involvement included right soft tissue (tumor in the thickness of the thoracic muscles), bone (L1-2), right pectoral soft tissue, lymph node broncho pulmonal, bilateral lung and bone (Th2, left caput humeral, left ilium).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Cyclophosphamide, methotrexate and fluorouracil (dose: 3 cycles each)	Approximately 17 years prior to study entry	Approximately 17 years prior to study entry
Surgery	Curative	Right radical mastectomy	Approximately 17 years prior to study entry	–
Cancer therapy	Adjuvant	Doxorubicin (dose: 3 cycles)	Approximately 17 years prior to study entry	Approximately 16 years prior to study entry
Radiotherapy	Adjuvant	Mediastinum (dose: 38 cGy)	Approximately 16 years prior to study entry	Approximately 16 years s prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 16 years prior to study entry	Approximately 12 years prior to study entry
Radiotherapy	Metastatic	Mediastinum (dose: 40 cGy)	Approximately 12 years prior to study entry	Approximately 11 years prior to study entry

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension, osteochondrosis, pain in extremity (right arm), hypoesthesia, hepatic cyst, and hemangioma of liver.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bisoprolol/perindopril, famotidine, ondansetron, diphenhydramine, and tramadol.

Event: Schwannoma (Schwannoma of the spinal canal C5-C6)

Prior to the event of schwannoma, the most recent dose of paclitaxel was administered on Study Day 596 and ipatasertib (300 mg) on Study Day 609.

On Study Day 604, the patient was suspected with schwannoma of the spinal canal at C5-C6. On Study Day 621, the patient was hospitalized. Study Day 623, the patient underwent removal of subtotal intracapsular lesion and extradural cystic neoplasm in right spinal canal and root canal at level of C5-C6, thus lateral stenosis of spinal canal was eliminated. On Study Day 629, the histology confirmed the diagnosis of Grade 3 schwannoma. She received treatment with thioctic acid, serrapeptase, pregabalin and diclofenac/lidocaine for schwannoma. On Study Day 632, the patient was discharged from the hospital. The event of schwannoma remained unresolved at the time of patient′s death (see narrative below).

Due to this event, study treatment with ipatasertib and paclitaxel was interrupted on Study Day 609 and Study Day 708, respectively and was never resumed (see narrative below).

The Investigator considered schwannoma to be unrelated to paclitaxel and ipatasertib and related to concurrent illness (unspecified).

Study treatment with ipatasertib was permanently discontinued due to other reason with the last dose given on Study Day 609.

The patient received on study anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Other collar area on the right (dose: 36 cGy) and bone (lower thoracic spine) (dose: 32 cGy)	651	696

On Study Day 723, a radiographic response assessment showed disease progression with new lesion in left lung (segment 5 and 8).

On Study Day 729, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose given on Study Day 708. The patient entered into the long-term follow-up.

On Study Day 1080, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304878	Patient number	1074
Demographics:	40-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Spinal fracture SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER 2 negative right breast cancer (T3N0M0) approximately 7 years prior to study entry.

On Study Day -430, the patient was diagnosed with locally recurrent disease. On Study Day –48, she was diagnosed with metastatic disease with ER/PR negative and HER 2 negative disease in metastatic tissue. At screening, sites of disease involvement included (right adrenal gland and bone (spine C6, L2, L3 and right femur).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Surgery	Curative	Right lumpectomy	Approximately 7 years prior to study entry	NA
Radiotherapy	Adjuvant	Breast (right chest wall) (dose: 1000 cGy, 4 fractions)	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Radiotherapy	Adjuvant	Breast (right chest wall) (dose: 5000 cGy, 25 fractions)	Approximately 7 years prior to study entry	Approximately 6 years prior to study entry
Surgery	Curative	Right simple mastectomy	-379	NA
Surgery	Curative	Right breast (re-excision of surgical margins)	-184	NA
Radiotherapy	Metastatic	Bone (C-6) (dose: 3000 cGy, 10 fractions)	-29	-15

No medical or surgical history was reported. Concurrent condition included bone pain.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included paracetamol/tramadol.

Event: Spinal fracture

Prior to the event of spinal fracture, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 2.

On Study Day 2, the patient experienced Grade 2 back pain (non-serious, unrelated). Treatment with paracetamol/tramadol was maintained and she was receiving pamidronate prophylactically from Study Day 1 for bone metastasis.

On Study Day 3, the patient presented to the emergency room with ongoing bone pain. A spine MRI with enhancement revealed osteolytic bony destruction with soft tissue mass at L 2 and L 3 vertebral bodies with pathological fracture, L 3 with posterior cortical bulging with thickening and contrast enhancement along the posterior longitudinal ligament causing L 3 spinal canal stenosis. There was no involvement in L 2-5 level. She was hospitalized with the diagnosis of Grade 3 spinal fracture. She was started on treatment with morphine, pethidine, codeine/ibuprofen/paracetamol, and pelubiprofen. On Study Day 5, posterior spinal fusion surgery was performed. It was reported that her pain improved and there was no sensory abnormality. She further received treatment with ketorolac, hydromorphone, tapentadol and dexketoprofen for bone/back pain. On Study Day 5, the event of spinal fracture was considered resolved. On Study Day 7, she experienced Grade 1 (initial intensity) left leg paresthesia (non-serious, unrelated). She was started on treatment with gabapentin. On Study Day 8, she was discharged from the hospital. On Study Day 10, the event of back pain improved to Grade 1. On Study Day 81, the events of back pain and paresthesia worsened to Grade 2 and remained unresolved at the time of patient′s death.

The patient received on-study radiotherapy as listed in the table below:

Treatments	Start Day	Stop Day
Radiotherapy to bone (L2-3), dose: 2800 cGy, 4 fractions	29	34

Due to this event, study treatment with ipatasertib was interrupted on Study Day 3 and Cycle 1 Day 8 and Day 15 dose of paclitaxel was interrupted. The next dose of ipatasertib and paclitaxel was given on Study Day 42.

The Investigator considered spinal fracture to be unrelated to ipatasertib and paclitaxel and related to disease under study.

On Study Day 97, a radiographic assessment showed disease progression.

On Study Day 99, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 85 and Study Day 89, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to bone (hip): 3000 cGy, 10 fractions	110	125
Capecitabine (1 cycle)	145	158
Radiotherapy to whole brain: 2100 cGy, 7 fractions	162	170

On Study Day 183, the patient died due to disease progression. No autopsy was performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Fatigue	1	Non-serious	4	Unresolved	Related	Related
Alopecia	2	Non-serious	11	Unresolved	Unrelated	Related
Pruritus	1	Non-serious	32	37	Unrelated	Unrelated
Decreased appetite	1	Non-serious	44	Unresolved	Related	Related
Diarrhea	1	Non-serious	53	55	Related	Related
Myalgia	1	Non-serious	57	59	Unrelated	Related
Diarrhea	1	Non-serious	58	62	Related	Related
Dysuria	1	Non-serious	59	Unresolved	Unrelated	Unrelated

Constipation	1	Non-serious	90	Unresolved	Unrelated	Unrelated
Nausea	1	Non-serious	90	Unresolved	Unrelated	Unrelated

Study Number/CRTN:	CO40016/314283	Patient number	1087
Demographics:	60-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Hyperthermia SAE		
Event 3 (PT) Category:	Hypotension AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative, right breast cancer (T3N3M0) on Study Day −698.

On Study Day −27, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER 2 status not assessed in metastatic tissue. At screening, sites of disease involvement included lung (right upper lobe and multiple lung tissue metastases on both sides) and lymph node (retrocaval, preaortic, aortic window and bifurcation node).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	-556	-493
Surgery	Curative	Right radical mastectomy	-447	NA
Cancer therapy	Adjuvant	Doxorubicin and docetaxel (2 cycles each)	-424	-393
Radiotherapy	Adjuvant	Postoperative scar area of the right breast and lymph outflow area (dose: 42 cGy, 16 fractions)	-258	-238

No medical or surgical history was reported. Concurrent conditions included hypertension, pyelonephritis chronic, obesity, angina pectoris, endometrial hyperplasia, uterine leiomyoma, goitre and thrombocytopenia.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

On Study Day 8, the patient experienced Grade 1 diarrhea (non-serious, related) for which she received treatment with loperamide (total daily dose: 12 mg). On Study Day 10, diarrhea was considered resolved.

Event 1: Diarrhea
Event 2: Hyperthermia
Event 3: Hypotension

Prior to the events of diarrhea, hyperthermia and hypotension, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 24, the patient experienced non-serious Grade 2 diarrhea. Treatment with loperamide was maintained. On Study Day 27, she presented with diarrhea up to 6-7 times per day and Grade 2 hyperthermia (body temperature 39 C) with severe weakness and was hospitalized on the following day (Study Day 28). On the same day (Study Day 28), she was noted with non-serious Grade 3 hypotension (blood pressure value not reported). She received unspecified IV fluids, paracetamol for hyperthermia and unspecified medication for hypotension. On Study Day 29, the events of hyperthermia and hypotension were considered resolved. On Study Day 51, she was discharged from the hospital. On Study Day 57, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	4	PO	1	8
Diarrhea	12	PO	8	10
Prophylaxis of diarrhea	4	PO	10	81

There was no change in the study treatment due to the event of hyperthermia.

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, due to the event of hypotension, Cycle 2 of paclitaxel was interrupted, and the next dose was given on Study Day 67 (Cycle 3 Day 1) at a reduced dose of 65 mg/m^2.

Due to the events of diarrhea and hypotension, study treatment with ipatasertib was permanently discontinued with the last dose of ipatasertib administered on Study Day 21.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered hyperthermia and hypotension to be related to ipatasertib and paclitaxel.

On Study Day 112, a radiographic response assessment showed disease progression with new lesions in bilateral paracaval and paraaortic lymph nodes.

On Study Day 115, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 106. The patient entered into the long-term follow-up.

On Study Day 205, the patient died due to disease progression. No autopsy was performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/318263	Patient number	1093
Demographics:	45-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Abdominal pain SAE		
Event 2 (PT) Category:	Nausea SAE		
Event 3 (PT) Category:	Vomiting SAE		
Event 4 (PT) Category:	Fatigue SAE		
Event 5 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		
Event 6 (PT) Categories:	Peritonitis SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER 2 equivocal left breast cancer (T1N0M0), approximately 4 years and 3 months prior to study entry.

On Study Day −78, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included bilateral upper lung.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left partial mastectomy	Approximately 4 years and 2 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 4 years and 2 months prior to study entry	Approximately 3 years and 11 months prior to study entry

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Whole breast (dose: 5040 cGy, 28 fractions)	Approximately 3 years and 11 months prior to study entry	Approximately 3 years and 10 months prior to study entry
Radiotherapy	Adjuvant	Breast (dose: 900 cGy, 5 fractions)	Approximately 3 years and 10 months prior to study entry	Approximately 3 years and 9 months prior to study entry

The patient′s medical history included cholelithiasis. Surgical history included cholecystectomy. Concurrent conditions included major depression, insomnia and anxiety.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included escitalopram, zolpidem and alprazolam. She started receiving loperamide (total daily dose: 4 mg) for diarrhea from Study Day 1.

Event 1: Abdominal pain
Event 2: Nausea
Event 3: Vomiting

Prior to the event of abdominal pain, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 4.

On Study Day 5, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib) and Grade 3 abdominal pain. Treatment with loperamide was maintained for diarrhea and she was started on tiropramide for abdominal pain. On Study Day 12, she experienced Grade 2 nausea and vomiting (both non-serious, related to paclitaxel). She received treatment with lorazepam.

Prior to the serious events of nausea and vomiting, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 13.

On Study Day 14, the event of diarrhea was considered resolved; however, the events of nausea and vomiting worsened to Grade 3.

On Study Day 15, the patient was hospitalized due to abdominal pain, nausea and vomiting. Her abdominal X-ray was reported to be normal on Study Days 15-16. It was further reported that she had diarrhea only on the day of hospitalization. She received treatment with granisetron, tramadol and tiropramide and was kept NPO until Study Day 16. She also received prophylactic treatment with pantoprazole for abdomen discomfort and nutritional support. On Study Day 18, she resumed oral intake. On Study Day 19, a repeat abdominal X-ray was normal. The events

of abdominal pain, nausea and vomiting gradually improved and on Study Day 20, the event of abdominal pain was reported to have improved to Grade 1. On the same day (Study Day 20), the events of abdominal pain, vomiting and nausea were considered resolved and the patient was discharged from the hospital.

Due to the events of nausea and vomiting, there was no change in study treatment with ipatasertib; however; due to the event of abdominal pain, ipatasertib was interrupted from Study Day 13 and the next dose was given on Study Day 20 at a reduced dose of 300 mg.

Due to the events of abdominal pain, nausea and vomiting, Cycle 1 Day 15 of paclitaxel was delayed and was given on Study Day 20.

The Investigator considered abdominal pain to be unrelated to paclitaxel and related to ipatasertib and other causes (unspecified).

The Investigator considered nausea and vomiting to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 62, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). On Study Day 71, she was noted with Grade 1 weight decreased (non-serious, unrelated) and Grade 1 anemia (non-serious, related to paclitaxel; hemoglobin: 8.5 mg/dL; normal range: 12-15.3 mg/dL). She received packed red blood cells transfusion for anemia and loperamide for diarrhea. No treatment was reported for the event of weight decreased.

Event 4: Fatigue

Prior to the event of fatigue, the most recent dose of paclitaxel was administered on Study Day 71 and ipatasertib (300 mg) on Study Day 78.

On Study Day 85, the patient was hospitalized with Grade 3 fatigue. A laboratory work-up showed WBC count 19440, absolute neutrophil count 15660, sodium 124, potassium 3.61, chloride 84, lactate dehydrogenase 294, erythrocyte sedimentation rate 58 and C-reactive protein 6.26 (units and normal ranges not reported). An influenza virus A and B antigen test was negative. She received nutritional support, hydration with normal saline and cefepime prophylactically for fever. On Study Day 86, a repeat laboratory work-up showed, sodium 129 and potassium 4.09 and chloride 94 (units and normal ranges not reported). She further received intravenous fluids (dextrose/sodium chloride/potassium chloride). On Study Day 85, anemia was considered resolved. On Study Day 89, the event of fatigue improved to Grade 1 and was considered resolved. On the same day (Study Day 89), the patient was discharged from the hospital. On Study Day 144, the event of diarrhea was considered resolved. The event of weight decreased was considered as resolving at the time of last report.

Due to the event of fatigue, Cycle 4 of study treatment with paclitaxel and ipatasertib was delayed and was given on Study Day 89.

The Investigator considered fatigue to be related to ipatasertib and paclitaxel.

On Study Day 12, the patient was diagnosed with Grade 1 neuropathy peripheral (signs/symptoms and diagnostic details not reported; non-serious, related to paclitaxel). She received treatment with tapentadol and pregabalin for neuropathy peripheral.

Event 5: Neuropathy peripheral
Event 6: Peritonitis

Prior to the event of Grade 3 neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 120 and ipatasertib (300 mg) on Study Day 126.

On Study Day 127, the ongoing event of neuropathy peripheral worsened to Grade 3 (symptoms not reported). Treatment with tapentadol and pregabalin was maintained.

Prior to the event of peritonitis, the most recent dose of paclitaxel was administered on Study Day 120 and ipatasertib (300 mg) on Study Day 143.

On Study Day 144, the patient presented to the hospital with abdominal pain. An abdomen-pelvis CT scan showed Grade 3 peritonitis leading to hospitalization. On the following day (Study Day 145), small bowel resection and segmental biopsy were performed. Pathological results revealed ulcer and perforation with diffuse acute serositis, marked submucosal and sub-serosal edema and transmural ischemic changes. She received treatment with cefepime, piperacillin/tazobactam and ciprofloxacin and also received calcium chloride/gluconate sodium/magnesium chloride/sodium acetate/sodium chloride, norepinephrine, albumin human, chlorphenamine, calcium chloride dihydrate/potassium chloride/sodium chloride/sodium lactate, glucose/potassium chloride/sodium chloride, pethidine, acetylcysteine and pantoprazole prophylactically. On Study Day 155, the event of peritonitis was considered resolved and she was discharged from the hospital. On Study Day 168, the event of neuropathy peripheral was considered resolved.

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 120.

Due to the event of peritonitis, study treatment with ipatasertib was permanently discontinued with the last dose given on Study Day 144. The patient entered into the long-term follow-up.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

The Investigator considered peritonitis to be unrelated to ipatasertib and paclitaxel and related to other unspecified causes.

On Study Day 972, the patient was permanently discontinued from the study as long term follow up was suspended due to final clinical cut-off date.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Decreased appetite	1	Non-serious	29	120	Unrelated	Related
Nausea	2	Non-serious	44	55	Unrelated	Related
Asthenia	2	Non-serious	50	55	Unrelated	Unrelated
Pyrexia	1	Non-serious	53	54	Unrelated	Unrelated
Headache	1	Non-serious	53	54	Unrelated	Unrelated
Nausea	2	Non-serious	57	144	Unrelated	Related
Abdominal pain	1	Non-serious	87	87	Related	Unrelated
Anemia	2	Non-serious	89	120	Unrelated	Related
Asthenia	2	Non-serious	168	Unresolved	Related	NA

Study Number/CRTN:	CO40016/ 305247	Patient number	1095
Demographics:	59-year-old female (Race unknown)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Diarrhea Grade $\geq$ 3 diarrhea		
Event 3 (PT) Category:	Glaucoma SAE		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER 2 negative right breast cancer (T1cN0M0), approximately 6 years prior to study entry.

On Study Day −63 the patient was diagnosed with metastatic disease with ER/PR and HER 2 negative in metastatic tissue. following right lymph node biopsy. At screening, sites of disease involvement included lymph node (right retro pectoral adenopathy), mediastinum and bone (multiple).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Epirubicin, fluorouracil and cyclophosphamide (3 cycles each)	Approximately 6 years prior to study entry.	Approximately 6 years prior to study entry.
Cancer therapy	Adjuvant	Docetaxel (3 cycles each)	Approximately 6 years prior to study entry	Approximately 6 years prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 5 years 9 months prior to study entry	−262

The patient′s medical history included rash papular. Surgical history included appendicectomy and cataract operation. Concurrent conditions included hypothyroidism, dyslipidemia, Arnold-Chiari malformation, hypoacusis, deafness, glaucoma, atopy, arthralgia, axillary pain and vision blurred.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included levothyroxine, ezetimibe, hypromellose and dorzolamide/timolol.

Event 1: Peripheral sensory neuropathy (lower limbs peripheral sensory neuropathy)

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 29.

On Study Day 30, the patient was diagnosed with non-serious Grade 1 (initial intensity) lower limbs peripheral sensory neuropathy (presenting signs and symptoms and diagnostic details not reported). On Study Day 80, she experienced Grade 1 peripheral sensory neuropathy of fingers (non-serious, related). On Study Day 156, the event of lower limbs peripheral sensory neuropathy worsened to Grade 2 and to Grade 3 on Study Day 167. She received treatment with pregabalin. The event of peripheral sensory neuropathy (lower limbs and fingers) remained unresolved at the time of study discontinuation.

Due to the event of peripheral sensory neuropathy (lower limbs), there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose administered on Study Day 154.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

Prior to the event of Grade 3 diarrhea, the patient experienced multiple episodes of diarrhea as listed in the table below. Treatment for the events included loperamide.

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	6	6	Related	Related
Diarrhea	1	Non-serious	9	30	Related	Related
Diarrhea	1	Non-serious	73	76	Related	Related

Event 2: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 91.

On Study Day 88, the patient experienced Grade 2 right upper abdominal pain (non-serious, unrelated). No treatment was reported for this event. On Study Day 92, she experienced non-serious Grade 1 (initial intensity) diarrhea. On Study Day 121, the event of diarrhea worsened to Grade 3 (6-8 stools per day). She received treatment with loperamide and racecadotril for the event. On Study Day 120, the event of upper abdominal pain was considered resolved. On Study Day 127, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	2	PO	1	1
Diarrhea	2	PO	6	6
Diarrhea	2	PO	15	15
Diarrhea	2	PO	29	29

Diarrhea	2	PO	400	400

Due to the event of diarrhea, study treatment with ipatasertib was interrupted on Study Day 126 and Cycle 5 Day 15 dose of paclitaxel was delayed. The next dose of paclitaxel and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 133.

The Investigator considered diarrhea to be related to ipatasertib and paclitaxel.

Event 3: Glaucoma (Worsening of glaucoma)

Prior to the event of glaucoma, the most recent dose of ipatasertib (400 mg) was administered on Study Day 189.

On Study Day 198, the patient′s pre-existing condition of glaucoma worsened to Grade 3 (considered serious as causing persistent or significant disability). Treatment with hypromellose and dorzolamide/timolol was maintained and she additionally received treatment with acetazolamide, bimatoprost, flurbiprofen, fluorometholone and hyaluronate. The event of glaucoma remained unresolved at the time of study discontinuation.

Due to this event, study treatment with ipatasertib was interrupted on Study Day 198 and the next dose was given on Study Day 210.

The Investigator considered glaucoma to be unrelated to ipatasertib and paclitaxel and related to concurrent illness.

On Study Day 404, a radiographic response assessment showed disease progression with new lesions in unspecified bilateral bone. On the same day (Study Day 404), study treatment with ipatasertib was permanently discontinued due to disease progression with last dose of ipatasertib administered on Study Day 404. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine (unknown cycles)	415	816
Radiotherapy to left iliac wing and left hip cup (dose: 2000 cGy, 5 fractions)	463	469
Radiotherapy to whole brain (dose: 3000 cGy, 10 fractions)	889	902

On Study Day 972, the patient was permanently discontinued from the study as per the physician's decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Nausea	1	Non-serious	2	37	Related	Related
Rhinitis allergic	1	Non-serious	3	126	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304777	Patient number	1106
Demographics:	63-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Macular edema SAE		
Event 2 (PT) Category:	Epiretinal membrane SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with lobular, moderately differentiated, ER/PR and HER 2 negative right breast cancer (T3N1MX), on Study Day –817.

On Study Day –243, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included right chest wall and left lung.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Epirubicin and cyclophosphamide (4 cycles each)	–798	–735
Cancer therapy	Neoadjuvant	Docetaxel (4 cycles)	–714	–651
Surgery	Curative	Right simple mastectomy, bilateral sentinel lymph node biopsy and unspecified surgery of left breast	–629	NA
Radiotherapy	Adjuvant	Right chest wall, 60X and right supraclavicular region, 6X (dose: 5000 cGy, 25 fractions)	–587	–551
Radiotherapy	Adjuvant	Right breast tumor bed, 6X (dose: 1000 cGy, 5 fractions)	–550	–544
Radiotherapy	Adjuvant	Left breast, 6X (dose: 5000 cGy, 25 fractions)	–528	–493
Radiotherapy	Adjuvant	Left breast tumor bed, 6X (dose: 1000 cGy, 5 fractions)	–490	–486

No medical or surgical history was reported. Concurrent conditions included macular edema and epiretinal membrane (both in right eye) and senile cataract (both eyes).

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications were ongoing at Study Day 1.

Event 1: Macular edema (Epiretinal membrane and macula edema OD)
Event 2: Epiretinal membrane (Epiretinal membrane and macula edema OD)

Prior to the events of macular edema and epiretinal membrane, the most recent dose of paclitaxel was administered on Study Day 99 and ipatasertib (400 mg) on Study Day 100.

On Study Day 101, the patient presented with blurred vision in the right eye. Her visual acuity in right eye was 6/10 cc and in left eye was 6/6 cc. Slit lamp exam revealed mild bilateral conjunctivitis and worsening of pre-existing condition of macular edema and epiretinal membrane to Grade 3, leading to hospitalization. She received treatment with dexamethasone, acetazolamide, diazepam, and triamcinolone; however, she was still experiencing blurry vision from her right eye. She was explained the risk and benefits of vitrectomy, membrane peeling and intravitreal administration of dexamethasone following which she underwent pars plana vitrectomy and was injected with dexamethasone intravitreal implant in the right eye. On Study Day 103, the events of macular edema and epiretinal membrane were considered resolved and she was discharged from the hospital on atropine, chloramphenicol, fluorometholone, gentamicin, timolol maleate and paracetamol.

There was no change in study treatment due to these events.

The Investigator considered macular edema and epiretinal membrane to be unrelated to paclitaxel and ipatasertib and related to concurrent illness.

On Study Day 275, an overall response assessment showed disease progression.

On Study Day 281, study treatment with paclitaxel and ipatasertib was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 267 and ipatasertib on Study Day 273. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	337	Ongoing

On Study Day 931, the patient was permanently discontinued from the study as per physician's decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Neutropenia	2	Non-serious	8	10	Unrelated	Related
Neutropenia	2	Non-serious	43	44	Unrelated	Related

Study Number/CRTN:	CO40016/318099	Patient number	1113
Demographics:	80-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Pulmonary embolism SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR and HER 2 negative left breast cancer (TXNXM0; histological grade unknown) on Study Day −664 following left modified radical mastectomy performed on the same day.

On Study Day −35, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included right mediastinum, pretracheal, precranial and subcarinal lymph nodes.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Paclitaxel (12 cycles)	−641	−564
Cancer therapy	Adjuvant	Cyclophosphamide and doxorubicin (4 cycles each)	−543	−480
Radiotherapy	Adjuvant	Left breast (dose: 50 cGy, 12 fractions)	−455	−423

No medical or surgical history was reported. Concurrent condition included hypertension.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included lansoprazole and perindopril.

Event: Pulmonary embolism

Prior to the event of pulmonary embolism, the most recent dose of paclitaxel was administered on Study Day 79 and ipatasertib (400 mg) on Study Day 84.

On Study Day 90, the patient was hospitalized with pain, dyspnea, edema and cough. A pulmonary CT-angiography was performed which showed hypodense filling defects in bilateral pulmonary artery and segmented branches. Subsequently, she was diagnosed with Grade 3 pulmonary embolism. She started receiving hydration and treatment with bemiparin, paracetamol and enoxaparin. On the following day (on Study Day 91), her laboratory work-up showed hemoglobin 10.5 g/dL (normal range: 11.2-15.7 g/dL) and she was diagnosed with Grade 2 anemia (initial intensity: Grade 1), (non-serious, related). She received red blood cells transfusion for anemia. On Study Day 93, venous doppler ultrasound of upper and lower extremity was normal except 34 x 13 mm cyst in left popliteal fossa. She further received treatment with methylprednisolone, furosemide and butamirate. On Study Day 96, she was discharged from the hospital. On Study Day 132, the event of pulmonary embolism was considered resolved. The event of anemia remained unresolved at the time of patient's death.

Due to the event of pulmonary embolism, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 123 with the last dose of paclitaxel administered on Study Day 79 and ipatasertib on Study Day 84. The patient entered into the long-term follow-up.

The Investigator considered pulmonary embolism, to be related to ipatasertib and paclitaxel.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine (2 cycles)	124	Ongoing

On Study Day 249, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Hyponatremia	3	Non-serious	1	8	NA	NA

Study Number/CRTN:	CO40016/304776	Patient number	1123
Demographics:	55-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Large intestine perforation SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative, metastatic left breast cancer (TXNXM1) on Study Day –22.

At screening, sites of disease involvement included left breast, hypodense lesion in segment IV of liver, multiple bone metastases, mild bilateral pleural effusion and left axillary lymphadenopathy.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included peripheral swelling, tumor ulceration, cancer pain and decreased appetite.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included diclofenac, morphine, paracetamol, metronidazole, tranexamic acid, and metoclopramide.

On Study Day 11, the patient experienced Grade 3 nausea (initial intensity: Grade 2), Grade 2 vomiting (both non-serious, related) and was also noted with Grade 1 weight decreased to 44.5 kg (screening body weight: 48 kg; non-serious, related). She received treatment with granisetron for nausea and vomiting. No treatment was given for the event of weight decreased.

Event: Large intestine perforation (perforation of the colon, splenic flexure)

Prior to the event of large intestine perforation, the most recent dose of paclitaxel was administered on Study Day 21 and ipatasertib (400 mg) on Study Day 26.

On Study Day 27, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib) and pain in right lower abdomen. She received treatment with loperamide (total daily dose: 8 mg) for this event. After few hours, the pain was cramping and distended.

On Study Day 28, she presented to the emergency room with mild abdominal distension and pain. Her vital signs were noted to be normal. Physical examination revealed hard abdomen with rebound pain and diffuse tenderness. A laboratory work-up also showed Grade 2 electrolyte imbalance (non-serious, related) with sodium 126 mmol/L (normal range: 136-145 mmol/L) and potassium 3.4 mmol/L (normal range: 3.5-5.1 mmol/L). It also showed WBC 17.09 K/μL (normal range: 3.54-9.06 x 10^3/μL), lactic acid 5.78 mmol/L, HSCRP (high-sensitivity C-reactive protein) 20.36 mg/dL (normal ranges not reported). It was reported that she had poor appetite recently.

On the same day (Study Day 28), her vital signs progressed with heart rate 108 bpm, respiratory rate 20 breaths/min and blood pressure 115/65 mmHg. A CT-scan showed colon perforation and pneumoperitoneum and she was diagnosed with Grade 4 large intestine perforation (initial intensity: Grade 3). Emergency surgery was suggested with high risk of complication. Surgical findings revealed necrotic changes of transverse colon at splenic flexure with large perforation, multiple perforations along transverse colon and proximal distal colon.

She underwent loop ileostomy and further received treatment with tramadol, fentanyl citrate, alprazolam, cefalexin, diosmectite, pantoprazole, imipenem, piperacillin, anidulafungin, dexmedetomidine, vitamins (unspecified), norepinephrine, sodium bicarbonate, albumin and thiamine. On Study Day 74, the event of electrolyte imbalance was considered resolved. On Study Day 79, the events of nausea, vomiting, large intestine perforation and diarrhea were considered resolved and she was discharged from the hospital. The event of weight decreased remained unresolved at the time of study discontinuation.

Due to this event, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 41 with the last dose of paclitaxel given on Study Day 21 and ipatasertib on Study Day 27. On the same day (Study Day 41), the patient was also discontinued from the study due to this event.

The Investigator considered large intestine perforation to be related to ipatasertib, paclitaxel, concurrent illness, and disease under study.

Other AE experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Depression	1	Non-serious	20	Unresolved	Unrelated	Unrelated

Study Number/CRTN:	CO40016/307254	Patient number	1134
Demographics:	55-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Nausea SAE		

The patient was randomized on Study Day -3.

The patient was diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, metastatic left breast cancer (T3N3bM1), on Study Day -48. At screening, sites of disease involvement included left breast, liver, left axillary lymph node and bone (multiple).

No past cancer treatment was reported.

No medical or surgical history was reported. Concurrent condition included pain.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

Event: Nausea

Prior to the event of nausea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 1.

On Study Day 1, the patient experienced Grade 1 (initial intensity) nausea and Grade 2 decreased appetite (non-serious, related). On Study Day 7, she experienced Grade 1 (initial intensity) diarrhea (once per day) (non-serious, related to ipatasertib). On Study Day 8, she received Cycle 1 Day 8 dose of paclitaxel as scheduled. The same day (Study Day 8), she experienced Grade 2 vomiting (non-serious, related) and the event of diarrhea worsened to Grade 2. On Study Day 10, she visited the emergency department due to persistent diarrhea, nausea and vomiting. On Study Day 11, nausea worsened to Grade 3, and she was hospitalized. She was diagnosed with Grade 2 enteritis infectious (non-serious, unrelated; diagnostic details not reported). She received treatment with loperamide, metoclopramide, potassium chloride/sodium chloride/sodium lactate, calcium chloride dihydrate/potassium chloride/sodium chloride/sodium lactate, vitamin B1/vitamin B6/vitamin B12, piperacillin sodium/tazobactam and domperidone. On Study Day 12, the event of vomiting was considered resolved. On Study Day 15, the event of diarrhea improved to Grade 1. On Study Day 16, the event of nausea improved to Grade 1 and the event of enteritis infectious was considered resolved. On Study Day 18, the events of nausea, decreased appetite and diarrhea were considered resolved and she was discharged from the hospital.

Due to the event of nausea, Cycle 1 Day 15 of paclitaxel was delayed and was given on Study Day 22; study treatment with ipatasertib was initially interrupted on Study Day 11 and was resumed at reduced dose of 300 mg on Study Day 22.

The Investigator considered nausea to be related to ipatasertib and paclitaxel.

On Study Day 107, a radiographic response assessment showed disease progression. Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib administered on Study Day 92 and Study Day 106, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Eribulin	120	198
Cyclophosphamide and doxorubicin (3 cycles each)	218	267
Radiotherapy to left breast (45 cGy, 15 fractions)	285	306
Gimeracil/oteracil/tegafur (1 cycle)	312	343

On Study Day 356, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/306641	Patient number	1139
Demographics:	37-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Pulmonary embolism SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative right breast cancer (T1aN0MX) on Study Day –427.

On Study Day −60, the patient was diagnosed with locally recurrent, metastatic disease with ER/PR and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included right lobe of liver, upper right lobe of lung and mediastinum lymph node.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin	−426	−365
Surgery	Curative	Right radical mastectomy	−325	NA

No medical/surgical history or concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included methylprednisolone.

Event: Pulmonary embolism

Prior to the event of pulmonary embolism, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 43.

On Study Day 57, the patient presented with severe dyspnea, cough, and chest pain. Arterial blood gas analysis showed low peripheral capillary oxygen saturation (value not reported). A thorax CT-scan showed Grade 4 pulmonary embolism**,** leading to hospitalization. She received treatment with tinzaparin, dexamethasone, hydrocortisone, sulfamethoxazole/trimethoprim, alprazolam, theophylline, furosemide, metoclopramide, fentanyl, and morphine. No information regarding discharge was reported. The event remained unresolved at the time of patient′s death (see narrative below).

There was no change in study treatment due to this event.

The Investigator considered pulmonary embolism to be unrelated to ipatasertib and paclitaxel and related to disease under study.

On Study Day 57, an overall response assessment showed disease progression with multiple new lesions in brain, bilateral liver (section II, III, V, VII), upper lobe of left adrenal gland and bilateral lung.

On Study Day 57, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of ipatasertib and paclitaxel given on Study Day 43. The patient entered into the long-term follow-up.

On Study Day 76, the patient died due to disease progression. An autopsy was not performed.

No other AEs were experienced by the patient during the study.

Study Number/CRTN:	CO40016/304623	Patient number	1142
Demographics:	72-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade $\geq$ 3 diarrhea		
Event 2 (PT) Categories:	Diarrhea SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative right breast cancer (T1cN1aMx), approximately 5 years prior to study entry.

On Study Day −62, the patient was diagnosed with locally recurrent unresectable disease with ER/PR and HER 2-negative disease in recurrent tissue. At screening, sites of disease involvement included right supraclavicular lymph node and right breast.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right partial mastectomy	Approximately 5 years prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin (4 cycles), cyclophosphamide (4 cycles) and paclitaxel (11 cycles)	Approximately 5 years prior to study entry	Approximately 4 years and 9 months prior to study entry
Radiotherapy	Adjuvant	Right breast tumor bed (dose: 90 cGy, 20 fractions)	Approximately 4 years and 7 months prior to study entry	Approximately 4 years and 6 months prior to study entry

The patient′s medical history included borrelia infection. Concurrent conditions included chronic obstructive pulmonary disease, cataract, hypertension, hypothyroidism, hypercholesterolemia, rheumatoid arthritis, stress urinary incontinence, osteoporosis, peripheral sensory neuropathy, and procedural pain of right axilla.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included curcumin/lecithin/*Mangifera indica*/*Piper nigrum*/pyridoxine/resveratrol/riboflavin, magnesium aspartate/potassium aspartate, aclidinium/formoterol, fenoterol/ipratropium, theophylline, levothyroxine, telmisartan, rosuvastatin, amlodipine, hydroxychloroquine, nebivolol, erdosteine, calcium carbonate, ibandronic acid, magnesium lactate, potassium chloride and gabapentin.

Event 1: Diarrhea (Grade 3)
Event 2: Diarrhea (Grade 2)

Prior to the first episode of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 3.

On Study Day 4, the patient experienced non-serious Grade 1 (initial intensity) diarrhea which on the same day, worsened to Grade 2. On the following day, (Study Day 5), the event of diarrhea worsened to Grade 3 (9 stools in a day). Treatment with loperamide was maintained and she received treatment with *Lactobacillus* helveticus. On Study Day 6, the patient experienced Grade 1 vomiting (non-serious, related to ipatasertib). She received treatment with thiethylperazine for vomiting. On Study Day 37, she experienced Grade 2 pyrexia (non-serious, related, body temperature not reported). On Study Day 41, the first episode of diarrhea was considered resolved.

Prior to the second episode of diarrhea, the most recent dose of paclitaxel was administered on Study Day 35 and ipatasertib (300 mg) on Study Day 41.

On Study Day 42, the patient experienced fever (body temperature not reported) and second episode of Grade 2 diarrhea. Laboratory work-up showed hyponatremia with sodium 129 mmol/L (normal range: 137-145 mmol/L), hypokalemia with potassium 3 mmol/L (normal range: 3.5-5.1 mmol/L), and hypomagnesemia with magnesium 0.65 mmol/L (normal range: 0.76-1.12 mmol/L). She was diagnosed with gastrointestinal toxicity. Subsequently, she was hospitalized. During hospitalization, her body temperature spiked to 38.3°C and she was also noted with tachycardia (heart rate not reported), hypotension 90/60 mmHg and oxygen saturation of 56%. She received treatment with paracetamol for fever, calcium chloride dihydrate/magnesium chloride hexahydrate/malic acid/potassium chloride/sodium acetate trihydrate/sodium chloride, potassium chloride, sodium chloride, magnesium sulfate and codeine for diarrhea. Grade changes for the event of diarrhea are mentioned in the table below. On Study Day 46, blood and urine cultures were positive for *Klebsiella pneumoniae* and she was diagnosed with Grade 2 pneumonia klebsiella (non-serious, unrelated). She received treatment with trimethoprim/sulfamethoxazole. On Study Day 48, the event of pneumonia klebsiella was considered resolved. On Study Day 49, the event of pyrexia was considered resolved. On the same day (Study Day 49), she was noted with Grade 3 hyperkalemia (initial intensity Grade 1; non-serious, unrelated). On Study Day 55, the event of hyperkalemia

resolved without any treatment. On Study Day 59, the patient was discharged from the hospital. The events vomiting and second episode of diarrhea remained unresolved at the time of patient's death (see narrative below).

55	130	5.1	0.98
56	131	4.9	0.92

Due to the non-serious event of diarrhea (Grade 3), Cycle 1 Day 8 dose of paclitaxel was not administered and study treatment with ipatasertib was interrupted on Study Day 8. The next dose of paclitaxel (at a reduced of 65 mg/m^2) and ipatasertib (at a reduced of 300 mg) was given on Study Day 16.

Due to the second episode of diarrhea, study treatment with ipatasertib and paclitaxel was permanently discontinued with the last dose of paclitaxel given on Study Day 35 and ipatasertib on Study Day 41. The patient entered into the long-term follow-up.

The Investigator considered first episode of diarrhea (Grade 3) to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered second episode of diarrhea (Grade 2) to be related to ipatasertib and paclitaxel.

On Study Day 176, a radiographic response assessment showed disease progression.

The patient received follow-up anti-cancer therapy as listed in the table below:

Treatments	Start Day	Stop Day
Radiotherapy to right supraclavicular (dose: 2 cGy, 1 fraction)	217	217

On Study Day 221, the patient died due to pulmonary embolism (further details not reported). Underlying cancer was the contributing factor. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Nausea	1	Non-serious	2	184	Related	Related
Vomiting	1	Non-serious	2	2	Related	Unrelated
Renal failure	2	Non-serious	8	15	Related	Related
Dyspnea	2	Non-serious	13	Unresolved	Unrelated	Unrelated

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Lipase increased	3	Non-serious	56	72	Related	Unrelated

Study Number/CRTN:	CO40016/305120	Patient number	1154
Demographics:	65-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Diarrhea SAE, AE leading to study treatment discontinuation, Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative left breast cancer (T2N3aM1) on Study Day −89.

On Study Day −70, metastatic disease was confirmed with ER/PR and HER 2-negative disease in metastatic tissue. At screening, sites of disease involvement included left breast, lymph nodes (left axillary and midline mediastinal), right upper lobe of lung, segment VII of liver and L1 vertebral bone.

No past cancer treatments were reported.

The patient′s medical history included hemolytic uremic syndrome, anxiety, and acute kidney injury. Concurrent conditions included irritable bowel syndrome, hypertension, gastroesophageal reflux disease, asthma, hypersensitivity, and blood pressure measurement.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amitriptyline, perindopril, mebeverine, esomeprazole, loratadine, atenolol, antacids and beclometasone.

On Study Day 2, the patient experienced Grade 1 intermittent abdominal pain upper (non-serious, related). Treatment with mebeverine was maintained.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 2.

On Study Day 3, the patient experienced Grade 1 (initial intensity) diarrhea. Treatment with loperamide and codeine was started. On Study Day 25, she experienced Grade 1 abdominal pain (non-serious, unrelated). She received treatment with trimethoprim. On Study Day 31, the event of abdominal pain was considered resolved.

On Study Day 38, the event of diarrhea worsened to Grade 3. The dose of loperamide was increased to 8 mg. Grade changes for diarrhea and loperamide dosing details are listed in the table below. The patient experienced 6 episodes of watery diarrhea on Study Day 65, for which she had taken codeine (4 doses) and loperamide (3 doses) On Study Day 66, she complained of 3 more episodes of diarrhea. She was advised to stop ipatasertib the same day. On the following day, (Study Day 67), the patient presented to the emergency room and reported 4 episodes of diarrhea. She was hospitalized. A laboratory work-up showed sodium 132 mmol/L, and urea 4.9 mmol/L (normal range not reported). Treatment with loperamide and codeine was maintained and was given single dose of IV antibiotic (unspecified) and 2 liters of IV hydration following which diarrhea improved. On Study Day 68, frequency of diarrhea decreased to 2 episodes. The same day (Study Day 68), the patient was discharged from the hospital. Diarrhea frequency further reduced to one on the following day (Study Day 69). On Study Day 70, the event of diarrhea was considered resolved with sequelae. At the time of patient′s death, the event of abdominal pain upper remained unresolved.

Diarrhea grade changes:

Study Day	Diarrhea grade changes
12	2
16	1
38	3
42	1
65	2
66	3
70	1

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	3	37
Diarrhea	8	PO	38	38
Diarrhea	2	PO	39	Ongoing

Due to this event, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was initially interrupted on Study Day 14 and was resumed on Study Day 17 at a reduced dose of 300 mg. Ipatasertib was further interrupted from

Study Days 38-49 and Study Days 66-77. Later, ipatasertib was permanently discontinued with the last dose given on Study Day 65.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 282, an overall response assessment showed disease progression with new lesion in right superior hilar lymph node.

On Study Day 307, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose given on Study Day 295. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Vinorelbine (6 cycles)	406	456
Epirubicin and cyclophosphamide (1 cycle each)	491	491

On Study Day 526, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Neutropenia	3	Non-serious	7	519	Unrelated	Related

Hordeolum	1	Non-serious	288	Unresolved	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304638	Patient number	1160
Demographics:	69-year-old White male		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Vomiting SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with poorly differentiated, ER/PR and HER 2-negative, locally advanced unresectable left breast cancer (T2N0M1; histological subtype not otherwise specified), on Study Day −139 following left breast biopsy performed on the same day.

On Study Day −86, metastatic disease was confirmed with ER/PR and HER 2-negative disease in metastatic tissue. At screening, sites of disease involvement included in left breast and right lung.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included hypertonia, type 2 diabetes mellitus, benign prostatic hyperplasia, and anemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received his first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included metformin, linagliptin, enalapril/hydrochlorothiazide, enalaprilat, amlodipine, nebivolol, doxazosin and tamsulosin.

Event: Vomiting

Prior to the event of vomiting, the most recent dose of paclitaxel and ipatasertib (400 mg) on Study Day 99.

On Study Day 100, the patient experienced Grade 4 vomiting (more than 10 episodes within 24 hours; considered medically significant) and Grade 2 anuria (non-serious, unrelated). Due to profuse vomiting, he received parenteral fluid supplementation and symptomatic therapy. He also received treatment with ondansetron and electrolytes (unspecified). On the following day (Study Day 101), the events of vomiting and anuria were considered resolved.

Due to this event, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 101 and the next dose was given on Study Day 102.

The Investigator considered vomiting to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 113, the patient withdrew consent from the study with the last dose of paclitaxel given on Study Day 99 and ipatasertib on Study Day 103.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Back pain	1	Non-serious	9	13	Unrelated	Unrelated
Anemia	3	Non-serious	84	98	Unrelated	Related

Study Number/CRTN:	CO40016/304336	Patient number	1178
Demographics:	61-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Tumor hemorrhage SAE		
Event 2 (PT) Category:	Tumor hemorrhage SAE		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR and HER 2-negative metastatic right breast cancer (T4N1M1) on Study Day –48. At screening, sites of disease involvement included right breast, right superior lobe of the lung, liver segment IV and lymph nodes (bilateral axillary, right subclavian and jugular).

No past cancer treatments were reported.

No medical or surgical history were reported. Concurrent conditions included tumor pain, hypertension, hyperthyroidism, anxiety, and anemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included gabapentin, thiamazole, ramipril, sertraline, alprazolam, folic acid, and ferrous sulfate.

On Study Day 92, the patient was noted with worsening of her pre-existing condition of anemia to Grade 3 (non-serious, unrelated; hemoglobin value not reported). The cause of anemia was unknown. Treatment with folic acid and ferrous sulfate was maintained and she further received blood transfusion therapy for the event anemia. On Study Day 101, the event of anemia (hemoglobin 9.7 g/dL; normal range: 12-16 g/dL) was considered resolved.

Event 1: Tumor hemorrhage (Tumor bleeding)

Prior to the event of tumor hemorrhage, the most recent dose of paclitaxel was administered on Study Day 169 and ipatasertib (400 mg) on Study Day 173.

On Study Day 174, the patient was noted with anemia (hemoglobin 7.7 g/dL, normal range not reported) and was diagnosed with Grade 3 tumor hemorrhage (diagnostic details and relevant laboratory work-up not reported), leading to hospitalization. It was reported that the anemia was caused by tumor bleeding. She received blood transfusion therapy. On Study Day 176, the event of tumor hemorrhage was considered resolved. On Study Day 177, she was discharged from the hospital.

There was no change in study treatment due to this event.

The Investigator considered tumor hemorrhage to be unrelated to ipatasertib and paclitaxel and related to concurrent illness.

Event 2: Tumor hemorrhage (Tumor bleeding)

Prior to the event of tumor hemorrhage, the most recent dose of paclitaxel was administered on Study Day 309 and ipatasertib (400 mg) on Study Day 312.

On Study Day 313, the patient was noted with anemia (hemoglobin 8.4 g/dL, normal range not reported) and was diagnosed with Grade 2 tumor hemorrhage (diagnostic details and relevant laboratory work-up not reported), leading to hospitalization on Study Day 314. It was reported that the anemia was caused by tumor bleeding. She received blood transfusion therapy.

The patient received on-study anti-cancer therapy as listed in table below:

Treatment	Start Day	Stop Day
Radiotherapy to breast (primitive tumor, dose: unknown cGy, 14 fractions)	317	336

Due to the event of tumor hemorrhage, study treatment with paclitaxel was interrupted after Study Day 309 and ipatasertib after Study Day 312 and later permanently discontinued.

On Study Day 336, the patient was discontinued from the study treatment as the patient had to receive the radiotherapy treatment with the last dose of paclitaxel was administered on Study Day 309 and ipatasertib on Study Day 312. The patient entered into the long-term follow-up.

On Study Day 355, the event of tumor hemorrhage was considered resolved and she was discharged from the hospital.

The Investigator considered tumor hemorrhage to be unrelated to ipatasertib and paclitaxel and related to disease under study.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Cisplatin (4 cycles) and fluorouracil (5 cycles)	492	NA
Pegylated liposomal doxorubicin hydrochloride	667	NA

On Study Day 778, the patient was permanently discontinued from the study as per the physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	13	13	Related	Unrelated

Fall	2	Non-serious	36	36	Unrelated	Unrelated
Alopecia	1	Non-serious	65	Unresolved	Unrelated	Related
Thrombocytosis	1	Non-serious	92	127	Unrelated	Unrelated
Pyrexia	2	Non-serious	93	94	Unrelated	Unrelated
Diarrhea	1	Non-serious	104	183	Related	Unrelated
Diarrhea	1	Non-serious	239	336	Related	Unrelated
Hypercholesterolemia	3	Non-serious	308	Unresolved	Unrelated	Unrelated

Study Number/CRTN:	CO40016/318136	Patient number	1180
Demographics:	65-year-old white female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Febrile neutropenia SAE		
Event 2 (PT) Category:	Anemia SAE		
Event 3 (PT) Category:	Urinary tract infection SAE		
Event 4 (PT) Category:	Pneumonia SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative, right breast cancer (T3N0M0; HER 2-receptor not assessed), approximately 4 years and 6 months prior to study entry.

On Study Day −88, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included bilateral liver (segment VII) and bilateral cranium bone.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Cyclophosphamide (6 cycles)	Approximately 4 years and 4 months prior to study entry	Approximately 4 years prior to study entry
Radiotherapy	Metastatic	Left femur bone (dose: 2000 cGy, 3 fractions)	−74	−70

No medical or surgical history was reported. Concurrent conditions included hypertension and pain.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included metoprolol.

Event 1: Febrile neutropenia
Event 2: Anemia
Event 3: Urinary tract infection

Prior to the event of febrile neutropenia, the most recent dose of paclitaxel was administered on Study Day 36 and ipatasertib (400 mg) on Study Day 40.

On Study Day 41, the patient experienced fatigue and her body was temperature 38°C. Laboratory work-up showed WBC count 1.19 $\times$ $10^3/\mu L$ (normal range: 4-10 $\times$ $10^3/\mu L$), neutrophil count 0.5, lymphocyte count 0.6 (units and normal range not reported) and increased CRP levels (value not reported). She was diagnosed with Grade 4 febrile neutropenia, leading to hospitalization. It was reported that the fatigue was secondary to febrile neutropenia. MRI of brain was performed since she was extremely prone to sleep; however, no metastasis was found. She received treatment with paracetamol, filgrastim and cefoperazone/sulbactam, following which her CRP level decreased. On Study Day 46, the event of febrile neutropenia was considered resolved and she was discharged from the hospital.

Due to the event of febrile neutropenia, Cycle 2 Day 15 dose of paclitaxel was not administered and ipatasertib was interrupted on Study Day 42.

Prior to the events of anemia and urinary tract infection, the most recent dose of paclitaxel was given on Study Day 36 and ipatasertib (400 mg) on Study Day 41.

On Study Day 59, the patient presented to the emergency room with fever (body temperature: 37.4°C) and excessive fatigue. Laboratory work-up showed hemoglobin 79 g/L (normal range: 115-155 g/L), WBC count 9.17 $\times$ $10^3/\mu L$, neutrophils 83.7% (normal range: 45-78%), lymphocytes 10.7% (normal range: 10-48%) and CRP 100 (units and normal range not reported). Urinalysis showed blood (+1). She was diagnosed with Grade 3 anemia and Grade 3 urinary tract infection, leading to hospitalization. She received blood transfusion treatment therapy for anemia and penicillin for urinary tract infection. On Study Day 61, the event of anemia was considered resolved. On Study Day 64, the event of urinary tract infection was considered resolved and she was discharged from the hospital.

Due to the events of anemia and urinary tract infection, study treatment with paclitaxel and ipatasertib remained interrupted. The next dose of paclitaxel at a reduced dose of 65 mg/m^2 and ipatasertib at a reduced dose of 300 mg due to the event of febrile neutropenia was given on Study Day 62.

Relevant lab values are listed in the table below:

Study Day	WBC count (normal range: 4-10 × $10^3/\mu L$)	Neutrophils (normal range: 45-78%)	Lymphocytes (normal range: 10-48%)	Hemoglobin (normal range: 130-175 g/L)	Body temperature (°C)

[a]units and normal range not reported

The Investigator considered febrile neutropenia to be unrelated to ipatasertib and related to paclitaxel.

The Investigator considered anemia to be unrelated to ipatasertib and related to paclitaxel and other unspecified causes.

The Investigator considered urinary tract infection to be unrelated to ipatasertib and paclitaxel and related to other unspecified causes.

Event 4: Pneumonia (lung infection)

Prior to the event of pneumonia, the most recent dose of paclitaxel was given on Study Day 62 and ipatasertib (300 mg) on Study Day 71.

On Study Day 72, the patient experienced fever (body temperature 38°C). Her C-reactive protein level was high (value not reported). She was diagnosed with Grade 3 pneumonia (diagnostic details not reported; cause unknown). On Study Day 74, she was hospitalized. She received treatment with ofloxacin. No information regarding discharge was reported. The event of pneumonia remained unresolved at the time of study discontinuation.

Due to the event of pneumonia, study treatment with paclitaxel was interrupted after Study Day 62 and ipatasertib after Study Day 73.

On Study Day 74, the patient withdrew consent from the study with the last of paclitaxel given on Study Day 62 and ipatasertib on Study Day 73.

The Investigator considered pneumonia to be unrelated to ipatasertib and paclitaxel related to other unspecified causes.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	2	Non-serious	5	73	Related	Related
Nausea	1	Non-serious	6	Unresolved	Unrelated	Related

Neuropathy peripheral	2	Non-serious	57	Unresolved	Unrelated	Related

Study Number/CRTN:	CO40016/304331	Patient number	1190
Demographics:	61-year-old white female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Tumor necrosis SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ER/PR and HER 2 negative right breast cancer (T3N1M0; histological confirmation not done), approximately 13 years prior to study entry following unspecified surgery of breast.

On Study Day −54, the patient was diagnosed with metastatic disease with ER/PR and HER 2-negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included lungs (right segment III and left segment II), lymph node (left axillary, left supraclavicular and multiple axillary), left adrenal gland and soft tissue (skin fold in left breast).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Methotrexate, fluorouracil and cyclophosphamide (2 cycles each)	Approximately 13 years prior to study entry	Approximately 13 years prior to study entry
Surgery	Curative	Right radical mastectomy	Approximately 13 years prior to study entry	NA
Cancer therapy	Adjuvant	Cyclophosphamide, fluorouracil and doxorubicin (3 cycles each)	Approximately 13 years prior to study entry	Approximately 12 years prior to study entry
Radiotherapy	Adjuvant	Right side lymph efflux (dose: 4000 cGy)	Approximately 13 years prior to study entry	Approximately 12 years prior to study entry

No medical or surgical history was reported. Concurrent conditions included essential hypertension, obstructive pancreatitis, spinal disorder (thoracic-lumbar spine), type 2 diabetes mellitus, lipoma (right kidney) and Grade 2 obesity.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amlodipine/valsartan and metformin.

Event: Tumor necrosis

Prior to the event of tumor necrosis, the most recent dose of paclitaxel was administered on Study Day 99 and ipatasertib (400 mg) on Study Day 105.

On Study Day 106, the patient experienced fever (body temperature upto 39°C) with shivering. Her laboratory work-up showed WBC count 15.88×10^9/L, and absolute neutrophil count 13.93×10^9/L (normal ranges not reported). An ultrasound of axillary area showed 5.5×4.5 cm formation with unclear contours with multiple hypo and echogenic elements probably caused by tumor lysis. She was diagnosed with Grade 2 (initial intensity) tumor necrosis. She received treatment with paracetamol, calcium chloride/magnesium chloride/potassium chloride/sodium chloride/sodium lactate, cefoperazone/sulbactam, metronidazole, calcium chloride/magnesium chloride/potassium chloride/sodium chloride/sodium lactate/sorbitol. On the following day (Study Day 107), her condition worsened with increasing fatigue, increase in body temperature and worsening of tumor necrosis to Grade 4. Subsequently, she was hospitalized. On Study Day 110, 100-120 mL of seropurulent fluid was drained. She further received treatment with levofloxacin, pantoprazole and ketoprofen. On Study Day 113, the event of tumor necrosis was considered resolved and she was discharged from the hospital.

The patient received on-study anti-cancer therapy as listed in table below:

Treatment	Start Day	Stop Day
Palliative surgery of left lymph node	113	NA

Due to this event, Cycle 4 Day 22 dose of paclitaxel was interrupted and ipatasertib was interrupted on Study Day 106. The next dose of ipatasertib and paclitaxel was given on Study Day 127.

The Investigator considered tumor necrosis to be related to ipatasertib and paclitaxel.

On Study Day 218, a radiographic response assessment showed disease progression.

On the same day (Study Day 218), study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 211 and Study Day 217 respectively. The patient entered into the long-term follow-up.

On Study Day 257, the patient died due to disease progression. An autopsy was performed (details not reported).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Dyslipidemia	1	Non-serious	57	Unresolved	Related	Unrelated
Blood alkaline phosphatase increased	1	Non-serious	64	71	Unrelated	Unrelated
Bronchitis	2	Non-serious	83	92	Unrelated	Unrelated
Anemia	2	Non-serious	85	Unresolved	Unrelated	Related
Hyperglycemia	2	Non-serious	106	Unresolved	Related	Unrelated
Postoperative wound complication	2	Non-serious	113	134	Unrelated	Unrelated
Respiratory tract infection viral	2	Non-serious	153	157	Unrelated	Unrelated
Pyrexia	2	Non-serious	201	205	Unrelated	Unrelated

Study Number/CRTN:	CO40016/318137	Patient number	1199
Demographics:	77-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	Diarrhea SAE, AE leading to study treatment discontinuation, Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Atrial fibrillation SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed locally advanced unresectable ductal, moderately differentiated, ER/PR and HER 2 negative left breast cancer (T3N3cM0), on Study Day −68. At screening, sites of disease involvement included right breast (upper posterior lobe), left breast and left axilla lymph node.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included hypertension, obesity and cardiac valve disease.

At screening, the patient′s ECOG Performance Status was 1. ECG at screening was normal. ECHO showed LVEF 60%.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included hydrochlorothiazide/losartan and metoprolol.

On Study Day 94, the patient experienced Grade 2 decreased appetite (non-serious, related to ipatasertib).

Event 1: Diarrhea
Event 2: Atrial fibrillation

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 92 and ipatasertib (400 mg) on Study Day 97.

On Study Day 98, the patient experienced Grade 3 diarrhea with poor oral intake.

Prior to the event of atrial fibrillation, the most recent dose of paclitaxel was administered on Study Day 92 and ipatasertib (400 mg) on Study Day 98.

On the following day (Study Day 99), a laboratory work-up showed sodium 134 mmol/L (normal range: 136-146 mmol/L), potassium 3.4 mmol/L (normal range: 3.5-5.1 mmol/L), calcium 8.2 mg/dL (normal range: 8.8-10.6 mg/dL), magnesium 1.1 mg/dL (normal range: 1.9-2.5 mg/dL), lactate dehydrogenase 258 U/L (normal range: 0-247 U/L) and serum creatinine 1.56 mg/dL (normal range: 0.51-0.95 mg/dL). Urine and stool test were also performed (results not reported). On the same day (Study Day 99), she was hospitalized. She received treatment with metoclopramide, ciprofloxacin, methylprednisolone, potassium bicarbonate/potassium citrate monohydrate and pantoprazole.

On Study Day 105, an ECG showed Grade 1 atrial fibrillation, leading to prolongation of hospitalization. An echocardiography showed left ventricular hypertrophy, left atrial enlargement with normal left ventricular ejection fraction. She was also noted with mild mitral regurgitation but no prolapses, moderate tricuspid valve regurgitation with pulmonary hypertension to be 45 mmHg. She received treatment with metoprolol and enoxaparin. On the same day (Study Day 105), the event of diarrhea was considered resolved. On Study Day 109, she was discharged from the hospital. On Study Day 125, the event of decreased appetite was considered resolved. The event of atrial fibrillation was considered resolving at the time of patient's death (see narrative below).

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of Diarrhea	4	PO	1	4
Diarrhea	4	PO	37	39
Diarrhea	6	PO	45	45
Diarrhea	2	PO	76	76
Diarrhea	4	PO	77	77

Study Day	Sodium (normal range: 136-146 mmol/L)	Potassium (normal range: 3.5-5.1 mmol/L)	Calcium (normal range: 8.8-10.6 mg/dL)	Magnesium (normal range: 1.9-2.5 mg/dL)	Creatinine (normal range: 0.51-0.95 mg/dL)	LDH (normal range: 0-247 U/L)
Screening	135	3.6	9.5	1.8	1	162
99	134	3.4	8.2	1.1	1.56	258
100	135	3	7.5	–	1.45	–
102	139	2.5	7.3	–	1	–
103	140	3.4	7.3	–	0.96	–
104	140	4.1	7.8	–	0.87	–
105	139	3.6	8.2	–	0.89	–

Due to the event of diarrhea and atrial fibrillation, study treatment with paclitaxel was interrupted after Study Day 92 and was later permanently discontinued due to the event of diarrhea with the last dose given on Study Day 92. Study treatment with ipatasertib was interrupted on Study Day 99 and the next dose was given on Study Day 128 at a reduced dose of 300 mg.

The Investigator considered diarrhea and atrial fibrillation to be unrelated to paclitaxel and related to ipatasertib and disease under study.

On Study Day 310, study treatment with ipatasertib was permanently discontinued as per the physician’s decision (the patient's blinded information was shared with the team and the decision to continue an alternative treatment method for the patient was made by PI) with the last dose of ipatasertib administered on Study Day 309. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine (unknown cycles)	317	Ongoing

On Study Day 343, an overall response assessment showed disease progression.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Left breast lymph node resection	443	NA

On Study Day 715, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	1	Non-serious	2	21	Unrelated	Unrelated
Diarrhea	1	Non-serious	37	39	Unrelated	Related

Pneumonia	2	Non-serious	247	254	Unrelated	Unrelated

Study Number/CRTN:	CO40016/307262	Patient number	1201
Demographics:	45-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	Erythema multiforme SAE, AE leading to study treatment discontinuation		
Event 2 (PT) Categories:	Hypersensitivity SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR and HER 2 negative left breast cancer, (T2N0M0; histological grade unknown), approximately 12 years prior to study entry.

The patient was diagnosed with metastatic disease with ER/PR and HER 2-negative approximately 10 years prior to study entry. At screening, sites of disease involvement included in lungs (right lower lobe, multiple lesions bilaterally), multiple lesions bilateral unspecified bone and right mediastinum lymph node.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant*	Goserelin	Approximately 12 years prior to study entry.	Approximately 11 years prior to study entry.
Cancer therapy	Neo-Adjuvant	Paclitaxel and capecitabine	Approximately 12 years prior to study entry.	Approximately 12 years prior to study entry.
Surgery	Curative	Left simple mastectomy and axillary dissection	Approximately 12 years prior to study entry.	NA
Cancer therapy	Adjuvant	Cyclophosphamide and pirarubicin	Approximately 12 years prior to study entry.	Approximately 11 years prior to study entry.
Radiotherapy	Adjuvant	Breast (dose: 5000 cGy, 25 fractions)	Approximately 11 years prior to study entry.	Approximately 11 years prior to study entry.
Cancer therapy	Metastatic	Goserelin	Approximately 10 years prior to study entry.	Approximately 9 years prior to study entry.
Cancer therapy	Metastatic	Tamoxifen	Approximately 10 years prior to study entry.	Approximately 9 years prior to study entry.
Cancer therapy	Metastatic	Medroxyprogesterone	Approximately 9 years prior to study entry	Approximately 9 years prior to study entry
Surgery	—	Resection of metastatic lesion in lung	Approximately 9 years prior to study entry	NA
Cancer therapy	Adjuvant^	Capecitabine	Approximately 9 years prior to study entry	Approximately 8 years prior to study entry

*Goserelin was initiated under neo-adjuvant setting and continued through to adjuvant setting

^Capecitabine was given under adjuvant setting relative to metastatic resection (major protocol deviation)

No medical or surgical history was reported. Concurrent conditions included insomnia and cancer pain.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included zolpidem.

Event 1: Erythema multiforme
Event 2: Hypersensitivity (allergic reaction)

Prior to the event of erythema multiforme, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 8.

On Study Day 9, the patient experienced rash on back and neck. On the following day (Study Day 10), she presented to the emergency department due to abdominal pain, Grade 1 pyrexia (body temperature: 39.8°C), Grade 1 diarrhea, Grade 1 vomiting (all non-serious, related to ipatasertib) and spread of rash to trunk and limbs. Subsequently, she was hospitalized. She received treatment with calcium chloride dihydrate/potassium chloride/sodium chloride/sodium lactate for diarrhea and fever, paracetamol for fever. On the same day (Study Day 10), the event of vomiting was considered resolved. She further received treatment with dexchlorpheniramine; however, her rash was spreading. On Study Day 11, dermatologist suspected drug induced rash due to investigational drug or precipitated calcium carbonate/cholecalciferol or magnesium carbonate. A skin biopsy was performed, and rash was judged to be Grade 3 erythema multiforme (not caused by infection). Treatment with difluprednate, prednisolone (40 mg, IV), rupatadine and gentamycin was started; following which her condition improved. On Study Day 17, the event of diarrhea was considered resolved. On Study Day 18, the event of pyrexia was considered resolved. It was reported that her skin rash was improving, fairly relieved and remained only on trunk. Treatment with prednisone was reduced to 25 mg PO. On Study Day 23, the event of erythema multiforme improved to Grade 1 and she was discharged from the hospital.

Due to the event of erythema multiforme, there was no change in the study treatment with paclitaxel; however, study treatment with ipatasertib was permanently discontinued with the last dose given on Study Day 10.

Prior to the event of hypersensitivity, the most recent dose of paclitaxel was administered on Study Day 36; ipatasertib had already been discontinued.

On Study Day 36, at 14:32 hours, infusion with paclitaxel was started. At 14:52 hours, paclitaxel infusion was slowed because of increased coughing. At 15:00 hours, the patient's body temperature was 36.6°C, blood pressure was 122/84 mmHg, heart rate was 89 beats/min and SpO_2 was 98% in room air. Infusion with paclitaxel was continued. At 15:22 hours, coughing improved; however, she developed hives on bilateral upper limbs and abdomino-thoracic part without itching and dyspnea. Vitals showed body temperature 36.1°C, blood pressure 114/75 mmHg, heart rate 70 beats/min and SpO_2 98% in room air. She was diagnosed with Grade 2 allergic reaction (preferred term: hypersensitivity), leading to hospitalization. On the following day (Study Day 37), she experienced rash (site unspecified) due to allergic reaction. The dermatologist diagnosed it to be erythematous rash. She received treatment with dexchlorpheniramine and prednisolone; following which her general status became well. On Study Day 38, she was discharged from the hospital. She had good general condition and on Study Day 64, the events of erythema multiforme and hypersensitivity were considered resolved.

Due to the event of hypersensitivity, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 36. The patient entered into the long-term follow-up.

The Investigator considered erythema multiforme to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered hypersensitivity to be related to paclitaxel and unrelated to ipatasertib.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatment	Start Day	Stop Day
Paclitaxel albumin (18 cycles)	64	451

On Study Day 469, a radiographic response assessment showed disease progression with new lesion in brain (right temporal lobe).

The patient received follow-up anti-cancer therapies as listed in table below:

Treatment	Start Day	Stop Day
Eribulin (8 cycles)	507	668
Vinorelbine (unknown cycles)	682	Ongoing

On Study Day 713, the patient was permanently discontinued from the study as per physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	2	Non-serious	6	10	Unrelated	Related
Neutropenia	2	Non-serious	8	10	Unrelated	Related

Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea SAE		
Event 2 (PT) Categories:	Diarrhea SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2-negative, left breast cancer (T2N3M1), on Study Day −63 following left partial mastectomy performed on the same day.

On Study Day −36, metastatic disease was confirmed with ER/PR and HER 2-negative disease in metastatic tissue. At screening, sites of disease involvement included lymph node (right upper paratracheal, midline preaortic in mediastinum region).

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included hypertension and pulmonary embolism.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included irbesartan, troxerutin and edoxaban tosilate.

Event 1: Diarrhea
Event 2: Diarrhea

Prior to the first episode of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 8.

On Study Day 9, the patient experienced Grade 1 (initial intensity) diarrhea and nausea. On Study Day 12, diarrhea worsened to Grade 2. She received treatment with loperamide (details

in the table below) and cinchocaine/fluocortolone hexanoate/fluocortolone pivalate. On Study Day 14, she was hospitalized. Her ECOG performance status was reported to be 3. Stool culture was requested but the patient could not co-operate. Her WBC count was 3.19 x 10^9/L (normal range: 4-10 x 10^9/L) and neutrophil count was 1.43 x 10^9/L (normal range: 2-7 x 10^9/L), and infection was ruled out. On Study Day 18, the event of diarrhea was considered resolved and she was discharged from the hospital.

Due to the first episode of diarrhea, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 13 and was resumed at a reduced dose of 200 mg on Study Day 29.

Prior to the second episode of diarrhea, the most recent dose of paclitaxel was administered on Study Day 36 and ipatasertib (200 mg) was administered on Study Day 42.

On Study Day 43, the patient experienced second episode of Grade 2 diarrhea leading to hospitalization. Her ECOG performance status was reported to be 3. Stool culture was requested but the patient could not co-operate. On Study Day 47, the second episode of diarrhea was considered resolved and she was discharged from the hospital.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of Diarrhea	4	PO	1	1
Prophylaxis of Diarrhea	2	PO	2	2
Prophylaxis of Diarrhea	4	PO	5	6
Prophylaxis of Diarrhea	2	PO	7	8
Diarrhea	4	PO	9	9
Diarrhea	8	PO	10	11
Diarrhea	12	PO	12	13
Diarrhea	14	PO	14	14
Diarrhea	16	PO	15	15
Diarrhea	14	PO	16	16
Diarrhea	8	PO	17	18

Prophylaxis of Diarrhea	6	PO	31	33
Prophylaxis of Diarrhea	12	PO	34	36
Prophylaxis of Diarrhea	16	PO	37	37
Prophylaxis of Diarrhea	12	PO	38	40
Prophylaxis of Diarrhea	16	PO	41	41
Prophylaxis of Diarrhea	12	PO	42	42
Diarrhea	10	PO	46	46
Prophylaxis of Diarrhea	6	PO	47	51
Prophylaxis of Diarrhea	4	PO	52	54
Prophylaxis of Diarrhea	2	PO	55	55
Diarrhea	16	PO	74	74
Diarrhea	12	PO	75	76

Due to the second episode of diarrhea, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was permanently discontinued with the last dose given on Study Day 42.

The Investigator considered diarrhea (first episode) to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered diarrhea (second episode) to be unrelated to paclitaxel and related to ipatasertib and disease under study.

On Study Day 226, study treatment with paclitaxel was permanently discontinued due to possibility of neurotoxicity with the last dose given on Study Day 205. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Capecitabine (unknown cycle)	230	Ongoing

On Study Day 301, a radiographic response assessment showed disease progression with new lesion in brain (bilateral cerebral and right cerebellar).

On Study Day 422, the patient died due to disease progression. An autopsy was not performed.

Other events experienced by the patient during the study:

Study Number/CRTN:	CO40016/318146	Patient number	1237
Demographics:	54-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	COVID-19 pneumonia SAE, COVID-19 SAE		
Event 2 (PT) Category:	Hyperglycemia AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal poorly differentiated ER/PR and HER2 negative left breast cancer (T3N0M1), on Study Day −64

The patient was diagnosed with metastatic disease on Study Day −34 with ER /PR negative and HER 2 negative in metastatic tissue. At screening, sites of disease involvement included lung (nodule in apico-posterior segment and upper lobule), and lymph node (right axillary).

No past cancer treatment was reported.

No medical/surgical history was reported. The patient′s concurrent conditions included hyperglycemia, hypertension, dyslipidemia, spinal osteoarthritis, bronchitis, and hypertriglyceridemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included salbutamol, losartan, and simvastatin.

Event 1: COVID-19 pneumonia

Prior to the event of COVID-19 pneumonia, the most recent dose of paclitaxel was administered on Study Day 121 and ipatasertib (400 mg) on Study Day 124.

On Study Day 124, the patient presented to the emergency room due to dyspnea, dry cough, and tiredness; however, denied fever. On Study Day 125, a CT scan showed glass opacities with congruent areas of consolidation, bilateral multifocal distribution predominantly in peripheral and posterior region with involvement of less than 25% of the pulmonary parenchyma. She was diagnosed with pneumonia and was hospitalized. She received treatment with ceftriaxone was started. On Study Day 126, a laboratory work-up showed WBC count 10900/mm^3 (normal range: 3500-10500/mm^3), neutrophil count 9047/mm^3 (normal range: 1700-7000/mm^3), and lymphocyte count 1526/mm^3 (normal range: 1000-5000/mm^3). A PCR test for COVID-19 was positive and the event was re-assessed as COVID-19 pneumonia. It was reported that she had no travel history in past 2 weeks. She then received treatment with azithromycin; following which her condition improved. On Study Day 127, she was discharged from the hospital. On Study Day 128, the event of COVID-19 improved to Grade 2. On Study Day 137, the event of COVID-19 was considered resolved.

Due to this event, Cycle 5 Day 15 dose of paclitaxel was not administered and treatment with ipatasertib was interrupted on Study Day 128. The next dose of study treatment was administered on Study Day 142.

The Investigator considered COVID-19 to be related to paclitaxel and unrelated to ipatasertib.

Event 2: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 212 and ipatasertib (400 mg) on Study Day 223.

On Study Day 224, the patient′s pre-existing condition of hyperglycemia worsened to non-serious Grade 2 (glucose 160.1 mg/dL; normal range: 70-99 mg/dL). She received treatment with metformin and gliclazide. On Study Day 238, the event of hyperglycemia was considered resolved.

Relevant lab values are listed in the table below:

Study Day	**Glucose** (normal range: 70-99 mg/dL)	**HbA1c** (normal range: 4.4-6.5 %)
Screening	123.9	6.4
224	160.1	7.8
232	179.8	7.9

Due to this event, there was no change in study treatment with paclitaxel; however, ipatasertib was permanently discontinued with the last dose administered on Study Day 232.

The Investigator considered hyperglycemia to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 933, the study treatment with paclitaxel and study was permanently discontinued as per physician decision (patient to enter a rollover study) with the last dose given on Study Day 919.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304460	Patient number	1239
Demographics:	44-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Lymphocyte count decreased SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, PR and HER 2 negative left breast cancer (T2N1M0; ER status unknown) on Study Day −693.

On Study Day −50, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included left lower lobe of lung and bilateral lung nodules.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Cyclophosphamide and doxorubicin (4 cycles each)	−682	−634
Cancer therapy	Neoadjuvant	Paclitaxel (4 cycles)	−620	−578
Surgery	Curative	Left breast lumpectomy	−560	NA
Radiotherapy	Adjuvant	Left breast (dose: 6000 cGy, 30 fractions)	−515	−476

No medical or surgical history was reported. Concurrent condition included joint dislocation.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitants medications were ongoing at Study Day 1.

Event: Lymphocyte count decreased

Prior to the event of lymphocyte count decreased, the most recent dose of paclitaxel was administered on Study Day 43 and ipatasertib (400 mg) on Study Day 70. Cycle 3 of paclitaxel was not given as the patient could not visit the site for treatment administration due to COVID-19.

On Study Day 71, a laboratory work-up showed $0.10\times10^3/\mu L$ (normal range: $1.32\text{-}3.57\times10^3/\mu L$) and the patient was diagnosed with Grade 4 lymphocyte count decreased (considered serious as life-threatening). No treatment was reported for this event. On Study Day 97, the event of lymphocyte count decreased was considered resolved.

Relevant lab values are listed in the table below:

Study Day	WBC count (normal range: 4.4-11.3×10^3/μL)	Neutrophil count (normal range: 1.8-7.7×10^3/μL	Lymphocyte count (normal range: 1-4.8×10^3/μL)
Screening	3.27	2.01	0.95
60	3.82^	2.43@	0.89*
71	3.41^	1.99@	0.10*

^normal range: 4-10×10^3/μL, @normal range: 1.78-5.38×10^3/μL *normal range: 1.32-3.57×10^3/μL,

There was no change in study treatment due to this event.

The Investigator considered lymphocyte count decreased to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 167, a radiographic response assessment showed disease progression. Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 158 and ipatasertib on Study Day 164. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Gemcitabine and carboplatin (6 cycles each)	180	285
Carboplatin (2 cycles)	326	–

On Study Day 722, the patient was permanently discontinued from the study as per the physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/305252	Patient number	1242
Demographics:	66-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Dyspnea SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with moderately differentiated, ER/PR and HER 2 negative, left breast cancer (T3N0M0; histological subtype not otherwise specified), on Study Day −883.

On Study Day −484, the patient was diagnosed with locally recurrent disease and on Study Day −35, she was diagnosed with metastatic disease with ER/PR and HER 2-negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included infiltration of the chest wall.

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Cancer therapy	Neoadjuvant	Docetaxel (4 cycles)	−849	−786
Cancer therapy	Neoadjuvant	Cyclophosphamide and epirubicin (3 cycles each)	−765	−723
Surgery	Curative	Left radical mastectomy	−694	NA
Cancer therapy	Adjuvant	Capecitabine	−675	−499
Radiotherapy	Adjuvant	Left thoracic wall of breast (dose: 50 cGy, 25 fractions)	−637	−603
Cancer therapy	Neoadjuvant	Carboplatin and docetaxel (3 cycles each)	−464	−415
Surgery	Curative	Right simple mastectomy	−373	NA
Radiotherapy	Adjuvant	Right breast chest wall (dose: 50 cGy, 25 fractions)	−308	−270

The patient′s medical history included skin cancer, hypertriglyceridemia, colon cancer, uterine cancer and ruptured cerebral aneurysm. Concurrent conditions included hypertension, hypercholesterolemia, factor V Leiden mutation, obesity, hereditary non-polyposis colorectal cancer syndrome and lymphopenia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included fluindione and candesartan

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 5.

On Study Day 6, the patient experienced non-serious Grade 3 diarrhea. She received treatment with loperamide (details in table below), diosmectite and racecadotril. Grade changes for the event are reported in the table below. On Study Day 131, the event of diarrhea was considered resolved.

Diarrhea grade changes:

Study Day	Diarrhea grade changes
8	2
12	1
35	2
36	1
41	2
50	3
57	1

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of Diarrhea	4	PO	1	1
Diarrhea	4	PO	6	6
Diarrhea	24	PO	7	7
Diarrhea	4	PO	8	8
Diarrhea	6	PO	10	10
Diarrhea	4	PO	22	22
Diarrhea	2	PO	23	23
Diarrhea	2	PO	26	27
Diarrhea	8	PO	35	35
Diarrhea	4	PO	36	36
Diarrhea	8	PO	37	38

Diarrhea	4	PO	45	45
Diarrhea	8	PO	46	47

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	48	48
Diarrhea	8	PO	49	49
Diarrhea	6	PO	50	51
Diarrhea	8	PO	52	53
Diarrhea	6	PO	54	56
Diarrhea	4	PO	96	96
Diarrhea	8	PO	97	97

Due to this event, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was initially interrupted on Study Day 8 and resumed at a reduced dose of 300 mg on Study Day 22.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

Event 2: Dyspnea

Prior to the event of dyspnea, the most recent dose of ipatasertib (300 mg) was administered on Study Day 49 and paclitaxel on Study Day 57. Ipatasertib was interrupted from Study Day 57 due an unspecified adverse event.

On Study Day 68, a chest CT scan showed images with band of frosted glass in lungs.

On Study Day 71, the patient experienced Grade 4 dyspnea without cough and fever leading to hospitalization. No cardiac insufficiency was noted and a COVID-19 PCR test was reported to be negative and No treatment was reported for this event. On Study Day 77, the event of dyspnea was considered resolved.

Due to this event, study treatment with ipatasertib and paclitaxel was interrupted.

The Investigator considered dyspnea to be unrelated to paclitaxel and ipatasertib and related to other causes (morphine given as treatment for non-cardiac chest pain was stopped).

On Study Day 155, a radiographic response assessment showed disease progression with new lesion in skin (bilateral rib cage). Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 131 and ipatasertib on Study Day 140. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Eribulin (6 cycles)	148	188

On Study Day 412, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Non-cardiac chest pain	3	Non-serious	1	8	Unrelated	Unrelated
Hypomagnesaemia	2	Non-serious	7	89	Unrelated	Unrelated

Neutropenia	1	Non-serious	103	Unresolved	Unrelated	Related

Study Number/CRTN:	CO40016/304786	Patient number	1245
Demographics:	45-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade $\geq$ 3 hepatotoxicity		
Event 2 (PT) Category:	Aspartate aminotransferase increased Grade $\geq$ 3 hepatotoxicity		
Event 3 (PT) Categories:	COVID-19 SAE, COVID-19 SAE		

The patient was randomized on Study Day −3.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2-negative left breast cancer (T4bN1M0) on Study Day −847.

On Study Day −34, the patient was diagnosed with metastatic disease with ER/PR unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included lungs including left superior and right inferior lobe and lymph nodes (mediastinum, paratracheal and infracarinal).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin, cyclophosphamide, and docetaxel (4 cycles each)	−783	−586
Surgery	Curative	Left radical mastectomy	−472	NA

The patient's medical history included constipation and vomiting. Concurrent condition included arthralgia.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event 1: Alanine aminotransferase increased (ALT increased)
Event 2: Aspartate aminotransferase increased (AST increased)

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 7.

On Study Day 8, the patient was diagnosed with non-serious Grade 3 alanine aminotransferase increased (ALT 231.7 U/L; normal range: 4-36 U/L) and non-serious Grade 3 aspartate aminotransferase increased (AST 167.1 U/L; normal range: 8-33 U/L). No treatment was reported for these events. On Study Day 59, the events of alanine aminotransferase increased, and aspartate aminotransferase increased were considered resolved.

Relevant lab values are listed in the table below:

Study Day	AST (normal range: 8-33 U/L)	ALT (normal range: 4-36 U/L)	ALP (normal range: 35-104 U/L)	Total bilirubin (normal range: 2-21 μmol/L)
Screening	31.6	21.8	122	0.7*
1	30.8	30.8	107	0.27
8	167.1	231.7	120	0.8
15	31.4	48.4	110	0.4
22	64.9	85.4	137	0.26

Study Day	AST (normal range: 8-33 U/L)	ALT (normal range: 4-36 U/L)	ALP (normal range: 35-104 U/L)	Total bilirubin (normal range: 2-21 μmol/L)
31	33.1	56.1	Not done	Not done
38	47.3	58.7	119	6.7
45	33.7	40.7	117	0.6*
59	30.5	24.5	97	0.6*

*Normal range: 0-1.4 mg/dL

Due to this event, study treatment with ipatasertib and paclitaxel was interrupted on Study Day 8. The next dose of paclitaxel (at a reduced dose of 65 mg/m^2) and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 15.

The Investigator considered alanine aminotransferase increased and aspartate aminotransferase increased to be related to ipatasertib and paclitaxel.

Event 3: COVID-19

Prior to the event of COVID-19, the most recent dose of paclitaxel was administered on Study Day 122 and ipatasertib (300 mg) on Study Day 128.

On Study Day 124, the patient experienced cough, fatigue and myalgia. On Study Day 129, she underwent a thorax CT, and the results were not clinically relevant. On Study Day 131, the patient a polymerase chain reaction (PCR) swab tested was positive and she was diagnosed with medically significant Grade 1 COVID-19. She had no travel/contact history prior to symptoms. On Study Day 150 and Study Day 164, her swab PCR test was again positive. She received treatment of codeine/paracetamol and budesonide/formoterol.

On Study Day 156, a radiographic response assessment showed disease progression.

Due to the event of COVID-19, study treatment with paclitaxel and ipatasertib was interrupted on Study Day 122 and Study Day 128, respectively and was never resumed due to disease progression (see narrative below).

On Study Day 165, the event of COVID-19 was considered resolved.

On Study Day 165, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 122 and ipatasertib on Study Day 128. The patient entered into the long-term follow-up.

The Investigator considered COVID-19 to be unrelated to ipatasertib and paclitaxel and related to concurrent illness.

The patient received follow-up anti-cancer therapy as listed in the table below:

Treatments	Start Day	Stop Day
Gemcitabine and cisplatin (unknown cycles)	165	530

On Study Day 620, the patient was permanently discontinued from the study as long term follow-up was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Diarrhea	1	Non-serious	97	104	Related	Related

Study Number/CRTN:	CO40016/305649	Patient number	1247
Demographics:	53-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Diarrhea SAE, Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with poorly differentiated, ER/PR and HER 2-negative left breast cancer (T4bN1M0; histological subtype: other) on Study Day −126.

On Study Day −74, the patient was diagnosed with locally advanced unresectable disease with ER/PR and HER 2-negative disease in recurrent tissue. At screening, sites of disease involvement included upper quadrant of left breast and left axillary lymph node.

No past cancer treatments were reported.

The patient′s medical history included chronic gastritis and gastroesophageal reflux disease. Concurrent conditions included anemia, cancer pain and anxiety.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide (total daily dose: 4 mg) for diarrhea.

Concomitant medication ongoing at Study Day 1 included tramadol.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 3.

On Study Day 4, the patient experienced Grade 1 (initial intensity) diarrhea. On Study Day 7, she experienced Grade 1 vomiting, Grade 1 dyspepsia and Grade 2 dehydration (all non-serious, related to ipatasertib). She received treatment with sodium chloride for dehydration, ondansetron for vomiting and bismuth subsalicylate and hyoscine butylbromide for dyspepsia. On the same day, the events of dehydration and vomiting were considered resolved.

On Study Day 14, she was noted with Grade 1 hypomagnesemia (non-serious, unrelated; magnesium: 1.48 mg/dL; normal range: 1.6-2.6 mg/dL). On Study Day 21, she experienced Grade 1 (initial intensity) vomiting (non-serious, related to ipatasertib). On Study Day 25, she experienced 8 episodes of diarrhea associated with vomiting. The events of vomiting and diarrhea were assessed as worsened to Grade 3 leading to hospitalization. A laboratory work-up showed Grade 3 dehydration (non-serious, related to ipatasertib). A stool culture performed was negative. On the same day, the dose of ongoing loperamide was increased to 12 mg (total daily dose). She further received ondansetron, and dimenhydrinate for vomiting, sodium chloride and unspecified electrolytes for dehydration, magnesium sulfate for hypomagnesemia and omeprazole for dyspepsia. Grade changes for diarrhea and loperamide dosing details are listed in the table below.

On Study Day 26, the patient was diagnosed with Grade 1 parasitic gastroenteritis (non-serious, unrelated; diagnostic details not reported). On the same day (Study Day 26), diarrhea improved to Grade 1 and also the events of vomiting, and hypomagnesemia were considered resolved. On Study Day 27, dehydration was considered resolved. On Study Day 28, the patient was discharged from the hospital. She further received treatment with nitazoxanide for parasitic gastroenteritis and *Bacillus clausii* spores for diarrhea. On Study Day 33, the events of diarrhea and parasitic gastroenteritis was considered resolved. On Study Day 39, the event of dyspepsia was considered resolved.

Diarrhea grade changes:

Study Day	Diarrhea grade changes
9	2
12	1
20	2
22	1
23	2
25	3
26	1

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	6
Diarrhea	6	PO	7	10
Diarrhea	8	PO	11	12
Diarrhea	12	PO	13	14
Diarrhea	6	PO	15	22
Diarrhea	8	PO	23	24
Diarrhea	12	PO	25	25
Diarrhea	8	PO	26	27
Diarrhea	6	PO	28	33
Diarrhea	4	PO	43	56
Diarrhea	6	PO	57	59
Diarrhea	10	PO	60	60
Diarrhea	6	PO	61	66

Relevant lab values are listed in the table below:

Study Day	Sodium (normal range: 135-145 mEq/L)	Potassium (normal range: 3.3-5.4 mEq/L)	Magnesium (normal range: 1.6-2.6 mg/dL)
Screening	144	5	2.23
1	134	4.9	2.1
8	132	5.2	2.13
14	135	3.8	1.48
43	135	4.8	2.13
49	136	5	2.16
56	136	4.3	2.14

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 11 and the next dose was given on Study Day 15. Ipatasertib was again interrupted on Study Day 26 and resumed at a reduced dose of 300 mg on Study Day 43.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 60, a radiographic response assessment showed disease progression.

On Study Day 79, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 57 and ipatasertib on Study Day 63. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Doxorubicin and cyclophosphamide (1 cycle each)	81	81
Radiotherapy to left breast and supraclavicular axillo region lymph node (dose: 4500 cGy, 18 fractions)	168	212

On Study Day 284, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Vomiting	1	Non-serious	1	1	Unrelated	Unrelated
Nausea	1	Non-serious	7	10	Related	Unrelated
Dyspnea	1	Non-serious	8	8	Unrelated	Related
Flushing	2	Non-serious	8	8	Unrelated	Related
Infected neoplasm	2	Non-serious	11	14	Unrelated	Unrelated
Pruritus	1	Non-serious	13	55	Unrelated	Related

1.4 NARRATIVES FOR PATIENTS WHO EXPERIENCED ADVERSE EVENTS LEADING TO STUDY TREATMENT DISCONTINUATION

Study Number/CRTN:	CO40016/304778	Patient number	1003
Demographics:	76-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	Pneumonia SAE, AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Hyperglycemia Grade ≥ 3 Hyperglycemia		
Event 3 (PT) Category:	Glucose tolerance impaired Grade ≥ 3 Hyperglycemia		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304753	Patient number	1007
Demographics:	69-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER2 negative right breast cancer (T1cN0MX), approximately 10 years prior to study entry.

The patient was diagnosed with metastatic disease approximately 4 years and 9 months prior to study entry with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lymph node (aortopulmonary and manubrium sternum) and lung (upper right pulmonary lobe).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right simple mastectomy	Approximately 10 years prior to study entry	NA
Cancer therapy	Adjuvant	Fluorouracil, doxorubicin, cyclophosphamide, and paclitaxel (3 cycles each)	Approximately 10 years prior to study entry	Approximately 10 years prior to study entry
Radiotherapy	Adjuvant	Right breast (dose: 5040 cGy, 28 fractions)	Approximately 10 years prior to study entry	Approximately 10 years prior to study entry
Radiotherapy	Metastatic	Right lymph node (dose: 7080 cGy, 29 fractions)	Approximately 4 years and 6 months prior to study entry	Approximately 4 years and 5 months prior to study entry

The patient′s medical history included lumbar spinal stenosis. Surgical history included spinal operation and central venous catheterization. Concurrent conditions included meningioma, pain, dizziness, osteoarthritis, and intervertebral disc protrusion.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event: Neuropathy peripheral (peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 100 and ipatasertib (400 mg) on Study Day 106.

On Study Day 114, the patient was diagnosed with non-serious Grade 3 neuropathy peripheral (presenting signs and symptoms not reported). No treatment was given for this event. On Study Day 142, the event of neuropathy peripheral improved to Grade 2.

On Study Day 218, the patient experienced Grade 1 (initial intensity) sciatica (non-serious, unrelated). On Study Day 221, the event of sciatica worsened to Grade 2. She received treatment with diclofenac, ibuprofen, and metamizole for the event of sciatica. On Study Day 254, she developed non-serious Grade 1 paralysis of the recurrent laryngeal nerve (non-serious, causality with study treatment reported as not applicable). No treatment was given for this event. The event of paralysis of the recurrent laryngeal nerve was considered resolving and the events of sciatica and neuropathy peripheral remained unresolved at the time of patient′s death.

Due to this event, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 100.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 225, a radiographic response assessment showed disease progression with new lesion in bone (right ilium corpus).

On Study Day 240, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 218. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Carboplatin (3 cycles)	261	338
Pegylated liposomal doxorubicin (3 cycles)	359	415
Radiotherapy to osteolysis of sacrum bone (dose: 3000 cGy, 12 fractions)	363	442
Radiotherapy to mediastinal and right hilar lymph node (dose: 4000 cGy, 12 fractions)	468	489

On Study Day 928, the patient died to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	12	Resolving	Related	Unrelated
Fatigue	1	Non-serious	15	Unresolved	Unrelated	Unrelated
Cough	2	Non-serious	32	114	Unrelated	Unrelated
Nasopharyngitis	1	Non-serious	40	64	Unrelated	Unrelated
Alopecia	2	Non-serious	40	40	Unrelated	Related
Asthenia	1	Non-serious	64	142	Related	Related
Breast pain	1	Non-serious	223	Resolving	Unrelated	N/A

Study Number/CRTN:	CO40016/304878	Patient number	1015
Demographics:	55-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Neutropenia SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304194	Patient number	1022
Demographics:	61-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Categories:	Pulmonary embolism Death due to adverse event, SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/304878	Patient number	1061

Demographics:	68-year-old Asian female
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort	Cohort A
Event (PT) Category:	Neutrophil count decreased AE leading to study treatment discontinuation

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR and HER 2 negative right breast cancer (T2N0M0; histological grade unknown), approximately 11 years prior to study entry.

On Study Day −68, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included right pleural effusion, right paratracheal lymph node, spine and bilateral lungs.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right breast modified radical mastectomy and sentinel right lymph node biopsy	Approximately 11 years prior to study entry.	NA
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 11 years prior to study entry	Approximately 11 years prior to study entry

The patient′s medical history included spinal stenosis. No surgical history was reported. Concurrent conditions included diabetes mellitus, hypertension, hyperlipidemia and dyspnea.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amlodipine besilate/telmisartan, cilostazol, *Artemisia argyi*, gemfibrozil, pitavastatin, anagliptin/metformin, chlorphenamine, chlorhexidine and codeine/ibuprofen/paracetamol.

On Study Day 8, a laboratory work-up showed WBC count $1.3\times10^3/\mu L$ (normal range: $4\text{-}10\times10^3/\mu L$) and neutrophils 44.7% (normal range: 50-75%). The patient was diagnosed with Grade 3 neutrophil count decreased (non-serious, related). On Study Day 15, the event of

neutrophil count decreased worsened to Grade 4. She received treatment with lenograstim. On Study Day 21, the event of neutrophil count decreased was considered resolved.

Due to this event, study treatment with paclitaxel and ipatasertib was initially interrupted on Study Day 8 and the next dose of paclitaxel (at a reduced dose of 65 mg/m^2) and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 22.

Event: Neutrophil count decreased

Prior to the event of neutrophil count decreased, the most recent dose of paclitaxel was administered on Study Day 29 and ipatasertib (300 mg) on Study Day 35.

On Study Day 36, a laboratory work-up showed WBC count $1.2\times10^3/\mu L$ (normal range: $4\text{-}10\times10^3/\mu L$) and neutrophils 20.9% (normal range: 50-75%). The patient was diagnosed with non-serious Grade 4 neutrophil count decreased. She received treatment with lenograstim. On Study Day 56, the event of neutrophil count decreased was considered resolved.

Relevant lab values are listed in the table below:

Study Day	**WBC count** (normal range: $4\text{-}10\times10^3/\mu L$)	**Neutrophils** (normal range: 50-75%)
Screening	4.7	56.2
1	5.2	62.0
8	1.3	44.7
15	2.2	12.5
22	4.2	55.0
29	3.3	51.0
36	1.2	20.9
57	4.1	62.6

Due to this event, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 57 with the last dose of paclitaxel given on Study Day 29 and ipatasertib on Study Day 35. The patient entered into the long-term follow-up.

The Investigator considered neutrophil count decreased to be related to ipatasertib and paclitaxel.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Paclitaxel	57	Ongoing

On Study Day 1076, the patient was permanently discontinued from the study as per physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Peripheral sensory neuropathy	1	Non-serious	2	Unresolved	Unrelated	Related
Myalgia	1	Non-serious	2	Unresolved	Related	Related
Nausea	1	Non-serious	2	15	Related	Related
Vomiting	1	Non-serious	2	3	Related	Related
Hyperglycemia	2	Non-serious	6	56	Related	Unrelated
Vomiting	1	Non-serious	8	9	Unrelated	Unrelated
Diarrhea	1	Non-serious	8	10	Related	Unrelated
Asthenia	2	Non-serious	8	Unresolved	Related	Related
Edema peripheral	1	Non-serious	12	Unresolved	Unrelated	Related
Alopecia	2	Non-serious	17	Unresolved	Unrelated	Related

Dyspepsia	2	Non-serious	32	51	Related	Related

Study Number/CRTN:	CO40016/307260	Patient number	1069
Demographics:	68-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Peripheral motor neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, moderately differentiated Grade 2, ER/PR negative and HER2 negative left breast cancer (T2N1M0) approximately 2 years and 10 months prior to study entry followed by left breast biopsy performed on the same day.

The patient was diagnosed with metastatic disease on Study Day −34 with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lung (left upper lobular).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Paclitaxel (12 cycles) and trastuzumab (4 cycles)	Approximately 2 years 9 months prior to study entry	Approximately 2 years 7 months prior to study entry
Cancer therapy	Neoadjuvant	Epirubicin, fluorouracil and cyclophosphamide (4 cycles each)	Approximately 2 years 6 months prior to study entry	Approximately 2 years 4 months prior to study entry
Surgery	Curative	Left simple mastectomy	Approximately 2 years 3 months prior to study entry	NA
Cancer therapy	Adjuvant	Trastuzumab (18 cycles)	Approximately 2 years and 1 month prior to study entry	Approximately 1 year and 1 month prior to study entry

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension, insomnia, constipation, vertigo positional, edema peripheral, peripheral sensory neuropathy, hyperplastic cholecystopathy and dry eye.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included hyaluronate, telmisartan, alisma plantago-aquatica subsp. Orientale tuber/artemisia capillaries flower/atractylodes lancea rhizome/ Cinnamomum cassia bark/polyporus umbellatus sclerotium/poria CoCos sclerotium, triazolam, betahistine, lactomin and dimeticone.

Due to the event of Grade 2 diarrhea (initial intensity Grade 1; non-serious, related), study treatment with paclitaxel was reduced from 80 mg/m^2 to 65 mg/m^2.

Event 1: Peripheral sensory neuropathy (Worsening of peripheral sensory neuropathy)

Event 2: Peripheral motor neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 154 and ipatasertib (300 mg) on Study Day 161.

On Study Day 168, the ongoing event of peripheral sensory neuropathy worsened to Grade 2. She received treatment with duloxetine for peripheral sensory neuropathy. Relevant grade changes reported in the table below. The event of peripheral sensory neuropathy remained unresolved at the time of study discontinuation.

Prior to the event of peripheral motor neuropathy, the most recent dose of paclitaxel was administered on Study Day 203 and ipatasertib (300 mg) on Study Day 189.

On Study Day 210, the patient was noted with Grade 1 peripheral motor neuropathy. She received treatment with mecobalamin and duloxetine for peripheral motor neuropathy. Relevant grade changes reported in the table below. The events of peripheral sensory and motor neuropathy remained unresolved at the time of study discontinuation.

Relevant grade changes reported in the table below:

Event	Study Day	Grade change
Worsening of peripheral sensory neuropathy	294	1
Worsening of peripheral sensory neuropathy	483	2
Worsening of peripheral sensory neuropathy	490	1
Worsening of peripheral sensory neuropathy	518	2
Worsening of peripheral sensory neuropathy	791	3
Peripheral motor neuropathy	392	2
Peripheral motor neuropathy	419	1
Peripheral motor neuropathy	490	2
Peripheral motor neuropathy	791	3

Due to these events, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose given on Study Day 770 (Cycle 28 Day 15).

The Investigator considered peripheral sensory neuropathy and peripheral motor neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 1283, a radiographic response assessment showed disease progression with progression in target lesions.

On Study Day 1312, study treatment with ipatasertib and study was permanently discontinued due to disease progression with the last dose given on Study Day 1287.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/304776	Patient number	1070
Demographics:	66-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Febrile neutropenia SAE		
Event 2 (PT) Categories:	Rash AE leading to study treatment discontinuation, Grade ≥ 3 rash		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304641	Patient number	1075
Demographics:	75-year old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative, metastatic right breast cancer (T1cN3cM1), on Study Day -77. At screening, sites of disease involvement included lymph nodes (right axilla level II and III and right infraclavicular) and lung (right hilus).

No past cancer treatment was reported.

The patient′s medical history included leiomyoma. Surgical history included cholecystectomy and appendicectomy. Concurrent conditions included hypertonia and hyperchlorhydria.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included metoprolol, pantoprazole, indapamide/perindopril, amlodipine, perindopril, furosemide, potassium chloride and clopidogrel.

Event 1: Alanine aminotransferase increased (Increase liver function; ALT)
Event 2: Aspartate aminotransferase increased (Increase liver function; AST)

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 6.

On Study Day 7, a laboratory work-up showed ALT 230 U/L (normal range: 0-31 U/L) and AST 255 U/L (normal range: 0-37 U/L). The patient was diagnosed with non-serious Grade 3 alanine aminotransferase increased**,** and aspartate aminotransferase increased. No treatment was administered for these events. The events of alanine aminotransferase and aspartate aminotransferase increased remained unresolved at the time of study discontinuation.

Relevant lab values are listed in the table below:

Study Day	**AST** (normal range: 0-37 U/L)	**ALT** (normal range: 0-31 U/L)	**Total bilirubin** (normal range: 0-20.6 μmol/L)	**ALP** (normal range: 30-270 U/L)
Screening	15	15	7.3	95
1	16	14	4.9	100
7	255	230	30.4	184

Due to the events of alanine aminotransferase increased and aspartate aminotransferase increased, there was no change in study treatment with paclitaxel, however, study treatment with ipatasertib was permanently discontinued with the last dose of ipatasertib administered on Study Day 6.

The Investigator considered alanine aminotransferase increased and aspartate aminotransferase increased to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 11, the patient withdrew consent from the study with the last dose of paclitaxel administered on Study Day 7.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	4	11	Unrelated	Related
Asthenia	1	Non-serious	4	Unresolved	Unrelated	Unrelated
Hyperglycemia	2	Non-serious	7	Unresolved	Related	Unrelated
Diarrhea	2	Non-serious	9	Unresolved	Unrelated	Related

Study Number/CRTN:	CO40016/304778	Patient number	1079
Demographics:	64-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Hyperglycemia AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER 2 equivocal, left breast cancer (T1cN2MX), approximately 11 years prior to study entry.

On Study Day -352, the patient was diagnosed with ER/PR negative and HER 2 negative disease. At screening, sites of disease involvement included lymph node (lymphadenopathy in left side upper internal mammary chain), lung (right upper, lower, and middle lobe and nodule in posterior aspect of left lower lobe) and left pleural.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left modified radical mastectomy and left axillary lymph node dissection	Approximately 11 years prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin (3 cycles), cyclophosphamide, methotrexate and fluorouracil (6 cycles each)	Approximately 11 years prior to study entry	Approximately 10 years prior to study entry
Radiotherapy	Adjuvant	Left chest wall and supraclavicular fossa (dose: 4600 cGy, 23 fractions)	Approximately 10 years prior to study entry	Approximately 10 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen and exemestane	Approximately 10 years prior to study entry	Approximately 4 years and 9 months prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 3 years and 8 months prior to study entry	–348

The patient′s medical history included ulcerative gastritis, hyperthyroidism, diabetes mellitus inadequate control, seborrheic keratosis, lipoma and pleural fibrosis. Surgical history included thyroid nodule removal, central venous catheterization and thoracic operation. Concurrent conditions included type 2 diabetes mellitus, hyperglycemia (Grade 2), hepatic steatosis, uterine leiomyoma, gastritis, osteopenia, urinary incontinence and insomnia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included glimepiride, linagliptin, metformin and lorazepam.

Event 1: Diarrhea
Event 2: Hyperglycemia (Fasting hyperglycemia)

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. No test was performed to determine infectious etiology. On Study Day 12, the event of diarrhea

worsened to Grade 3. She received treatment with loperamide (details in table below). On Study Day 16, the event of diarrhea improved to Grade 1.

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 16.

On Study Day 17, the patient was noted with non-serious Grade 2 fasting hyperglycemia (glucose 195 mg/dL; normal range: 70-100 mg/dL). No treatment was given for the event. On Study Day 32, the event of diarrhea worsened to Grade 2 which improved to Grade 1 on Study Day 33. Relevant laboratory values are given in the table below. On Study Day 64, the event of diarrhea was considered resolved. On Study Day 85, the event of hyperglycemia was considered resolved.

Loperamide treatment details:

Indication	Total Daily Dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	4	PO	1	10
Diarrhea	4	PO	11	12
Diarrhea	6	PO	13	16
Diarrhea	4	PO	17	18
Diarrhea	4	PO	20	20
Diarrhea	2	PO	21	21
Diarrhea	2	PO	26	26
Diarrhea	4	PO	27	27
Diarrhea	2	PO	28	28
Diarrhea	4	PO	29	31
Diarrhea	6	PO	32	32
Diarrhea	4	PO	33	48
Diarrhea	6	PO	49	49
Diarrhea	4	PO	50	50
Diarrhea	6	PO	51	51
Diarrhea	4	PO	52	56

Relevant lab values are listed in the table below:

Study Day	Glucose (normal range: 70-100 mg/dL)	HbA1c (normal range: 4-6 %)
Screening	162	7.1
8	219	—
17	195	—
29	159	—
36	176	—
43	156	—
57	206	7.9
71	151	—
85	145	—

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 18 and was resumed at a

reduced dose of 300 mg on Study Day 29. Ipatasertib was again interrupted on Study Day 36 and was resumed at a further reduced dose of 200 mg on Study Day 43.

Due to the event of hyperglycemia, there was no change in study treatment with paclitaxel, however, study treatment with ipatasertib was permanently discontinued with last dose of ipatasertib administered on Study Day 56

The Investigator considered diarrhea to be unrelated to paclitaxel and related to ipatasertib and other unspecified causes.

The Investigator considered hyperglycemia to be unrelated paclitaxel and related to ipatasertib and concurrent illness.

On Study Day 388, a radiographic response assessment showed disease progression with new lesions in mediastinum (left side of lateral aortic arch) and bone (sternum and left 6th rib).

On Study Day 409, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 381. She entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Vinorelbine	409	484
Radiotherapy to whole brain plus brain boost (dose: 4500 cGy; 15 fractions)	499	519

On Study Day 822, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / non-serious**	**Onset Day**	**Resolution Day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Alopecia	2	Non-serious	24	Unresolved	Unrelated	Related
Hypomagnesemia	1	Non-serious	29	85	Unrelated	Unrelated
Neuropathy peripheral	2	Non-serious	29	Unresolved	Unrelated	Related
Influenza like illness	2	Non-serious	55	120	Unrelated	Unrelated
Diarrhea	1	Non-serious	160	262	NA	Unrelated

Cough	2	Non-serious	388	409	NA	Unrelated

Study Number/CRTN:	CO40016/304879	Patient number	1084
Demographics:	62-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Hyperglycemia Grade $\geq$ 3 hyperglycemia		
Event 2 (PT) Category:	Edema AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER positive, PR and HER 2 negative, left breast cancer (T1micN0M0) on Study Day −357.

On Study Day −49, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included left breast nodule, bilateral skin and bilateral axillary lymph node.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	—	Left modified radical mastectomy	−344	N/A
Cancer therapy	Metastatic	Anastrozole	−323	−60

No medical or surgical history was reported. Concurrent condition included diabetes mellitus.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included alogliptin/metformin.

Event 1: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 29 and ipatasertib (400 mg) on Study Day 35.

On Study Day 36, the patient was noted with non-serious Grade 3 hyperglycemia (blood glucose 299 mg/dL; normal range: 70-110 mg/dL). Treatment with alogliptin/metformin was maintained for diabetes mellitus. No additional treatment was reported for hyperglycemia. Grade changes during the event course are reported in the table below. On Study Day 92, the event of hyperglycemia improved to Grade 1. On Study Day 142, the patient was started on gliclazide for hyperglycemia. On Study Day 238, the event of hyperglycemia was considered resolved.

Hyperglycemia grade changes:

Study Day	Grade changes
43	2
57	3
85	2
92	1

Relevant lab values are listed in the table below:

Study Day	Glucose (normal range: 70-110 mg/dL)	HbA1c (normal range: 2-6%)
Screening	131	7
36	299	—
43	182	—
57	286	8.6
73	256	—
85	170	—
92	119	—
99	112	—
106	108	—
113	96	—
120	101	—
134	85	—
141	100	6.9
160	87	6.9
169	95	—
197	94	—
225	86	6.9
253	107	—

Due to this event, Cycle 4 Day 1 of paclitaxel was not administered and ipatasertib was interrupted on Study Day 85. The next dose of paclitaxel (Cycle 4 Day 8) and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 92.

The Investigator considered hyperglycemia to be related to ipatasertib and unrelated to paclitaxel.

Event 2: Edema

Prior to the event of edema, the most recent dose of paclitaxel was administered on Study Day 169 and ipatasertib (300 mg) on Study Day 174.

On Study Day 175, the patient developed non-serious Grade 2 edema (initial intensity: Grade 1). No treatment was reported for this event. The event of edema remained unresolved at the time of study discontinuation.

Due to the event of edema, there was no change in the study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose administered on Study Day 771.

The Investigator considered edema to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 836, a radiographic assessment showed disease progression.

On Study Day 841, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of ipatasertib given on Study Day 833. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine, atezolizumab and tiragolumab	869	NA

On Study Day 992, the patient was permanently discontinued from the study treatment as per the physician’s decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Alopecia	1	Non-serious	16	Unresolved	Related	Related
Diarrhea	1	Non-serious	38	238	Related	Unrelated

Demographics:	41-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Categories:	Diarrhea AE leading to study treatment discontinuation, Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal and not otherwise specified histological subtype, poorly differentiated, ER/PR and HER 2 negative, right breast cancer (T3N3M0), on Study Day -36.

On Study Day -33, the patient was diagnosed with locally advanced unresectable disease with ER/PR and HER 2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included lymph node (ganglion with fatty hilum in the right axilla) and right breast (external upper quadrant).

No past cancer treatment was reported.

No medical history was reported. Surgical history included carpal tunnel decompression. No concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient experienced non-serious Grade 1 (initial intensity) diarrhea. On Study Day 14, the event of diarrhea worsened to Grade 3. Stool culture and coprological functional and parasitological examinations were performed (results were pending). She

received treatment with loperamide (2 mg every 4 hours) and also received dietary advice. On the same day (Study Day 14), the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis for diarrhea	4	PO	1	2
Diarrhea	12	PO	13	14
Prophylaxis for diarrhea	2	PO	30	50
Prophylaxis for diarrhea	2	PO	58	78
Prophylaxis for diarrhea	2	PO	87	104

Due to this event, there was no change in study treatment with paclitaxel, however, dose of ipatasertib was reduced to 300 mg from Study Day 14.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel

Event 2: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 101 and ipatasertib (300 mg) on Study Day 103.

On Study Day 104, the patient experienced non-serious Grade 3 diarrhea (20 episodes in last 24 hours). She did not have fever or hypotension. She received hydration and treatment with loperamide until Study Day 104. On Study Day 106, the event of diarrhea improved to Grade 1 and was considered resolved.

Due to this event, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 121 with the last dose of paclitaxel administered on Study Day 101 and ipatasertib administered on Study Day 105. The patient entered into the long-term follow-up.

The Investigator considered diarrhea to be unrelated to ipatasertib and paclitaxel and related to other unspecified causes.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Unspecified surgery of right breast	128	NA
Capecitabine (2 cycles)	156	Ongoing
Radiotherapy to right breast (dose: 4050 cGy, 15 fractions)	227	254

On Study Day 550, the patient withdrew consent from the study.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	1	Non-serious	2	3	Unrelated	Unrelated
Musculoskeletal pain	1	Non-serious	4	5	Unrelated	Related

Study Number/CRTN:	CO40016/318813	Patient number	1108
Demographics:	65-year-old White and American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative right breast cancer (T1cN1aM1) on Study Day −60.

On Study Day −55, metastatic disease was confirmed with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lung (right segment VI, left medial basal segment), right breast and lymph node (retroperitoneum paraaortic nodule).

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included insomnia, hypertension and arthralgia.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included clonazepam and tramadol.

Event: Neuropathy peripheral (neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 57 and ipatasertib (300 mg) on Study Day 60. Ipatasertib was not given on Study Day 61 due to an unspecified adverse event.

On Study Day 62, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral (presenting symptoms and diagnostic details not reported). On Study Day 68, the event worsened to Grade 2 and further to Grade 3 on Study Day 75. She received treatment with gabapentin. Grade changes for neuropathy are listed in the table below. The event of neuropathy peripheral remained unresolved at the time of patient's death.

Neuropathy peripheral grade changes:

Study Day	Neuropathy peripheral grade changes
68	2
75	3
91	2
109	3
174	2
309	1

Due to this event, there was no change in the study treatment with ipatasertib; however, study treatment with paclitaxel was initially reduced to 65 mg/m^2 on Study Day 85 and then permanently discontinued with the last dose given on Study Day 99.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 311, an overall response assessment showed disease progression with new lesion in right axillary lymph nodes.

On Study Day 371, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 329. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Carboplatin (5 cycles)	443	Unknown

On Study Day 668, the patient died due to COVID-19 infection. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal and not otherwise specified histological subtype, poorly differentiated, ER/PR positive and HER 2-negative right breast cancer (T2N0M0) approximately 20 years prior to study entry, followed by the right breast ″other″ surgery and right axillary lymph node dissection performed on the same day.

On Study Day −92, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included pectoral muscle lymph node.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Right breast (dose: 50 cGy, 25 fractions)	Approximately 19 years prior to study entry.	Approximately 19 years prior to study entry.
Radiotherapy	Adjuvant	Breast tumor bed (dose: 10 cGy, 5 fractions)	Approximately 19 years prior to study entry.	Approximately 19 years prior to study entry.
Cancer therapy	Adjuvant	Cyclophosphamide, methotrexate, and fluorouracil (6 cycles each)	Approximately 19 years prior to study entry.	Approximately 19 years prior to study entry.

The patient′s medical history included left ankle fracture. No surgical history was reported. Concurrent conditions included hypertension and anxiety.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included perindopril, amlodipine, alprazolam, cholecalciferol, and calcium carbonate.

Event: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 43 and ipatasertib (400 mg) on Study Day 44.

On Study Day 45, the patient was diagnosed with non-serious Grade 1 **peripheral sensory neuropathy** (symptoms and diagnostic details not reported). On Study Day 243, the event worsened to Grade 3. She received treatment with vitamin B-complex and duloxetine. The event of peripheral sensory neuropathy remained unresolved at the time of study discontinuation.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 239.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 673, the patient withdrew consent from the study treatment with the last dose of ipatasertib given on Study Day 672. The patient entered into the long-term follow-up.

On Study Day 778, a radiographic response assessment showed disease progression.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to soft tissue (intra-pectoral lymph node) (dose: 3000 cGy, 10 fractions)	802	816

On Study Day 816, the patient was permanently discontinued from the study as per the physician’s decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/318721	Patient number	1177
Demographics:	76-year-old female (race unknown)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal and not otherwise specified histological subtype, poorly differentiated, ER/PR negative and HER 2 equivocal left breast cancer (T1cN1M1) on Study Day −68.

On Study Day −44, metastatic disease was confirmed with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included breast (left axillary), left axillary lymph node, soft tissue (large left back muscle) and bone (thoracolumbar spine).

No past cancer treatments were reported.

The patient′s medical history included pericarditis, large intestine polyp and right breast cyst. Concurrent conditions included hypertension, adjustment disorder with depressed mood, spinal pain and fibrocystic breast disease.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 2 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included paroxetine, atenolol, paracetamol, alprazolam, denosumab, calcium carbonate/cholecalciferol and pyridoxine.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 3.

On Study Day 4, the patient experienced non-serious Grade 1 intermittent diarrhea. Treatment with loperamide was maintained and she further received treatment with diosmectite. On Study Day 9, the event of diarrhea worsened to Grade 3. On Study Day 10, dose of loperamide was increased to 10 mg. On the same day (Study Day 10), the event of diarrhea improved to Grade 1. The event of diarrhea remained unresolved at the time of study discontinuation.

Loperamide treatment details:

Due to this event, study treatment with paclitaxel was reduced to 65 mg/m^2 on Study Day 85 and ipatasertib was reduced to 300 mg on Study Day 86.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

Event 2: Neuropathy peripheral (Neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 43 and ipatasertib (400 mg) on Study Day 49.

On Study Day 58, the patient was diagnosed with non-serious Grade 3 neuropathy peripheral (presenting signs and symptoms not reported). Treatment for the event included pregabalin. On Study Day 85, the event of neuropathy peripheral improved to Grade 2. Grade changes for neuropathy peripheral are listed in the table below. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Neuropathy peripheral grade changes:

Study Day	Neuropathy peripheral grade changes
85	2
148	1
183	2
223	1
254	3
268	2
422	2
436	1
444	2
505	3

Due to the event of neuropathy peripheral, there was no change in the study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 491.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 562, the patient was discontinued from the study as per physician's decision (no progression on RECIST; however, in view of clinical signs and trend to evolution, lesional progression). The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine (5 cycles)	570	Unknown

On Study Day 832, the patient was permanently discontinued from the study as per the physician's decision (long term follow-up terminated by Sponsor).

Other events experienced by the patient during the study:

Study Number/CRTN:	CO40016/305247	Patient number	1182
Demographics:	65-year-old female (race unknown)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER 2-negative right breast cancer (T1bN1aM0) approximately 7 years prior to study entry following right breast biopsy.

On Study Day −53, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lymph nodes (left supraclavicular, right hilar and right ″LOGE 4″).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Right breast (dose: 50Gy, 25 fractions)	Approximately 7 years prior to study entry	Approximately 6 years prior to study entry
Surgery	Curative	Right breast lumpectomy and axillary dissection	Approximately 7 years prior to study entry	NA
Cancer therapy	Adjuvant	Letrozole	Approximately 6 years prior to study entry	−22

The patient′s medical history included diverticulitis, ligament sprain (left knee) and left breast calcification. Surgical history included left breast tumor excision. Concurrent conditions included dermatitis contact, drug intolerance, hypertension, aortic valve incompetence, osteoarthritis, dyslipidemia and insomnia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included atorvastatin, ramipril, propranolol, bromazepam and hydroxyzine.

On Study Day 57, the patient was diagnosed Grade 1 foot neuropathy (preferred term: neuropathy peripheral; non-serious, related). On Study Day 68, she was diagnosed with Grade 1 hand neuropathy (preferred term: neuropathy peripheral; non-serious, related). No treatment was given for these events. On Study Day 134, the event of hand neuropathy was considered resolved.

Event: Neuropathy peripheral (Lower limbs peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 215 and ipatasertib (400 mg) on Study Day 220.

On Study Day 221, the patient experienced Grade 1 asthenia (non-serious related). On the same day (Study Day 221), the patient's foot neuropathy was reassessed, and she was diagnosed with non-serious Grade 3 lower limbs peripheral neuropathy (symptoms and assessment details not reported). No treatment was given for these events. On Study Day 258, the event of asthenia was considered resolved. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 215.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 448, a radiographic assessment showed disease progression with new lesions in mediastinal lymph nodes.

On the same day (Study Day 448), study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of ipatasertib given on Study Day 444. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Abemaciclib and anastrozole	467	522
Capecitabine (unknown cycles)	529	–

On Study Day 781, the patient was permanently discontinued from the study treatment as per the physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305629	Patient number	1192
Demographics:	71-year-old American Indian or Alaska native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ER/PR and HER2 negative left breast cancer (T3N0M1) (histopathology unknown), approximately 7 years prior to study entry.

The patient was diagnosed with metastatic disease on Study Day –46 with ER /PR unknown and HER2 not assessed in metastatic tissue. At screening, sites of disease involvement included bilateral breast, lymph nodes (superior mediastinal, left subclavian ganglion, right axillary and midline pericardium mediastinal), bilateral pleural effusion, and bone (left cervical ganglion).

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left radical mastectomy	Approximately 6 years prior to study entry	NA

No medical/surgical history was reported. The patient′s concurrent conditions included anemia and hypertension.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bisoprolol and losartan.

Event: Neuropathy peripheral (peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 261 and ipatasertib (400 mg) on Study Day 263.

On Study Day 264, the patient was diagnosed with non-serious Grade 2 neuropathy peripheral (presenting signs and symptoms not reported). No treatment was given for this event. On Study Day 285, the event of neuropathy peripheral improved to Grade 1.

On Study Day 464, the event of neuropathy peripheral was considered resolved.

Due to this event, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 303.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 474, a radiographic response assessment showed disease progression with new lesion in head (leptomeningeal infiltration).

On Study Day 474, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 452. The patient entered into the long-term follow-up.

On Study Day 486, the patient died to disease progression. No information regarding autopsy was reported.

Cohort	Cohort A		
Event (PT) Category:	Toxic neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative left breast cancer (T2N1M0) on Study Day −792 following left radical mastectomy.

On Study Day −106, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lymph nodes (left supraclavicular, right root of lung and midline perivascular).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	−758	−728
Cancer therapy	Adjuvant	Paclitaxel (4 cycles)	−728	−666
Radiotherapy	Adjuvant	Post-operative scar (site "other", dose: 46 cGy, 23 fractions)	−638	−607
Radiotherapy	Adjuvant	Parasternal lymph node (dose: 44 cGy, 21 fractions)	−638	−607
Radiotherapy	Adjuvant	Sub-supraclavicular and axillary lymph node (dose: 40 cGy, 20 fractions)	−638	−607

No medical history was reported. Surgical history included cholecystectomy and caesarean section. Concurrent conditions included osteoarthritis (knee), diabetes mellitus, hypertension, obesity, renal cyst (left kidney), hepatic cyst (liver segment VI).

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included metformin, indapamide/perindopril and bisoprolol.

Event: Toxic neuropathy (toxicity polyneuropathy)

Prior to the event of toxic neuropathy, the most recent dose of paclitaxel was administered on Study Day 71 and ipatasertib (400 mg) on Study Day 77.

On Study Day 81, the patient was diagnosed with non-serious Grade 1 toxic neuropathy. On Study Day 221, the event of toxic neuropathy, worsened to Grade 3. She received treatment with thioctic acid. The event of toxic neuropathy remained unresolved at the time of patient′s death (see narrative below).

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose of paclitaxel given on Study Day 218.

The Investigator considered toxic neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 399, a radiographic response assessment showed disease progression with new lesion in right neck lymph node.

On Study Day 405, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 386. The patient entered into the long-term follow-up.

On Study Day 700, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Alanine aminotransferase increased	1	Non-serious	15	43	Related	Related
Diarrhea	1	Non-serious	18	18	Related	Unrelated
Diarrhea	1	Non-serious	60	64	Related	Unrelated
Alopecia	2	Non-serious	60	280	Unrelated	Related
Pneumonia	2	Non-serious	312	319	Unrelated	Unrelated

Study Number/CRTN:	CO40016/318813	Patient number	1210
Demographics:	62-year-old American Indian or Alaska native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal poorly differentiated ER/PR and HER2 negative right breast cancer (T1N0M0), approximately 2 years and 11 months prior to study entry.

The patient was diagnosed with metastatic disease on Study Day −7 with ER /PR negative and HER2 negative in metastatic tissue. At screening, sites of disease involvement included lung (left upper lobe) and chest (node at right arm level).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right lumpectomy	Approximately 2 years and 10 months prior to study entry	NA
Surgery	Curative	Right radical mastectomy	−888	NA

No medical/surgical history was reported. No concurrent conditions were reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Neuropathy peripheral (peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 71 and ipatasertib (400 mg) on Study Day 77.

On Study Day 82, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral (presenting signs and symptoms not reported). On Study Day 218, the event of neuropathy peripheral worsened to Grade 2. She received treatment with gabapentin. On Study Day 300, the event of neuropathy peripheral improved to Grade 1.

On Study Day 442, the event of neuropathy peripheral was considered resolved.

Due to this event, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 239.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 765, the patient withdrew consent from study treatment with ipatasertib and study with the last dose given on Study Day 749.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	10	156	Related	Unrelated
Hypertriglyceridemia	2	Non-serious	141	183	Related	Unrelated
Blood cholesterol increased	1	Non-serious	141	183	Related	Unrelated
COVID-19	1	Non-serious	155	176	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305247	Patient number	1221
Demographics:	65-year-old female (Race unknown)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade $\geq$ 3 diarrhea		
Event 2 (PT) Categories:	Diarrhea AE leading to study treatment discontinuation, Grade $\geq$ 3 diarrhea		
Event 3 (PT) Category:	Fatigue AE leading to study treatment discontinuation		
Event 4 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		
Event 5 (PT) Category:	Paronychia AE leading to study treatment discontinuation		
Event 6 (PT) Category:	Onycholysis AE leading to study treatment discontinuation		
Event 7 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER2 negative left breast cancer (T1bN0M0), approximately 3 years and 9 months prior to study entry.

On Study Day −56, the patient was diagnosed with locally recurrent and metastatic disease with ER/PR and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included left skin, bone (multiple lesions) and left internal mammal lymph node.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left partial mastectomy	Approximately 3 years and 8 months prior to study entry	NA

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Inferior quadrant of left breast (dose: 66 cGy; 26 fractions)	Approximately 3 years and 6 months prior to study entry	Approximately 3 years and 5 months prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 3 years and 5 months prior to study entry	–30

The patient′s medical history included asthenia, hepatitis A, ectopic pregnancy with contraceptive device, hepatitis post transfusion, cervix carcinoma and pericarditis. Surgical history included hysterectomy. Concurrent conditions included hypercholesterolemia, factor V Leiden mutation, osteoporosis, meningioma, hypertension, scar pain, dyspnea, and insomnia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included melatonin, hydroxyzine, paracetamol, tinzaparin, verapamil and atorvastatin.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 2.

On Study Day 2, the patient experienced Grade 1 pyrexia (body temperature not reported), Grade 3 nausea, Grade 1 vomiting, Grade 2 decreased appetite (all non-serious, related). On Study Day 3, she experienced Grade 2 abdominal pain (non-serious, related) and non-serious Grade 3 diarrhea. She received treatment with loperamide and racecadotril for diarrhea, paracetamol for pyrexia and abdominal pain, metoclopramide and ondansetron for nausea and vomiting. On Study Day 10, the event of decreased appetite improved to Grade 1. On the same day (Study Day 10), the events of pyrexia, nausea, vomiting, abdominal pain and diarrhea were considered resolved. On Study Day 72, the event of decreased appetite was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	4	4
Diarrhea	6	PO	5	5
Diarrhea	10	PO	6	6
Diarrhea	4	PO	7	7
Diarrhea	6	PO	22	23
Diarrhea	2	PO	35	36

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	45	45
Diarrhea	4	PO	60	60
Diarrhea	4	PO	64	64

Due to the event of diarrhea, Cycle 1 Day 8 of paclitaxel was not administered; study treatment with ipatasertib was interrupted on Study Day 8. The next dose of paclitaxel and ipatasertib (at a reduced of 300 mg) was given on Study Day 22.

The Investigator considered diarrhea to be related to ipatasertib and paclitaxel.

On Study Day 26, the patient experienced Grade 1 (initial intensity) diarrhea (non-serious, related). She received treatment with racecadotril.

Diarrhea grade changes:

Study Day	Diarrhea grade changes
31	2
37	1
47	2

Event 2: Diarrhea
Event 3: Fatigue

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 64 and ipatasertib (200 mg) on Study Day 65.

On Study Day 66, the ongoing event of diarrhea worsened to non-serious Grade 3. She received treatment with racecadotril and loperamide.

Prior to the event of fatigue, the most recent dose of paclitaxel was administered on Study Day 64 and ipatasertib (200 mg) on Study Day 67.

On Study Day 68, the patient experienced non-serious Grade 3 fatigue. No treatment was given for the event of fatigue. On Study Day 72, the events of diarrhea and fatigue were considered resolved.

Due to the events of diarrhea and fatigue, Cycle 3 Day 15 dose of paclitaxel was delayed and later given on Study Day 78 (Cycle 3 Day 22). Study treatment with ipatasertib was permanently discontinued with the last dose given on Study Day 70.

The Investigator considered diarrhea and fatigue to be related to ipatasertib and unrelated to paclitaxel.

Event 4: Peripheral sensory neuropathy (Fingers sensitive neuropathy)

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 85.

On Study Day 86, the patient experienced non-serious Grade 1 peripheral sensory neuropathy of fingers**.** On Study Day 149, the event of peripheral sensory neuropathy worsened to Grade 2. No treatment was reported for this event. On Study Day 268, the event of peripheral sensory neuropathy improved to Grade 1. The event of peripheral sensory neuropathy remained unresolved at the time of study discontinuation.

Due to the event of peripheral sensory neuropathy, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 155.

The Investigator considered peripheral sensory neuropathy to be unrelated to ipatasertib and related to paclitaxel.

Event 5: Paronychia (Bilateral big toe paronychia)
Event 6: Onycholysis (Bilateral big toe onycholysis)

Prior to the events of onycholysis and paronychia, the most recent dose of paclitaxel was administered on Study Day 99.

On Study Day 101, the patient was diagnosed with non-serious Grade 2 bilateral big toe paronychia and non-serious Grade 2 bilateral big toe onycholysis. She received treatment with sodium hypochlorite, and clobetasol propionate and also dressing with duoderm. The events of paronychia and onycholysis remained unresolved at the time of study discontinuation.

Due to the events of paronychia and onycholysis, study treatment with paclitaxel was permanently discontinued.

The Investigator considered paronychia and onycholysis to be related to ipatasertib and paclitaxel.

Event 7: Neuropathy peripheral (Feet neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 155.

On Study Day 156, the patient was diagnosed with non-serious Grade 2 neuropathy peripheral of feet. No treatment was reported for this event. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Due to the event of neuropathy peripheral, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 155.

The Investigator considered neuropathy peripheral to be unrelated to ipatasertib and related to paclitaxel. The patient entered into the long-term follow-up.

On Study Day 461, a radiographic response assessment showed disease progression.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	475	Ongoing

On Study Day 670, the patient was permanently discontinued from the study as per the physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/318146	Patient number	1237
Demographics:	54-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	COVID-19 pneumonia SAE, COVID-19 SAE		
Event 2 (PT) Category:	Hyperglycemia AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/320127	Patient number	1248
Demographics:	69-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Polyneuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with not otherwise specified, moderately differentiated Grade 2 ER/PR negative and HER2 negative right breast cancer (T3N0M1) on Study Day −62.

On Study Day −62, the patient was diagnosed with pathological metastatic disease with ER /PR negative and HER2 negative disease followed by right breast biopsy performed on the same day. At screening, sites of disease involvement included bilateral mediastinum lymph node, left lymph node root of lung and right lateral breast.

No past cancer treatment was reported.

The patient′s medical history included chemical burn and skin graft. Surgical history included caesarean section and appendicectomy. Concurrent conditions included hyperglycemia, diabetes mellitus, hypertension, obesity, renal cyst, hiatus hernia, chronic gastritis, duodenogastric reflux and asthenia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included indapamide, bisoprolol, amlodipine, empagliflozin, metformin/vildagliptin and metformin.

Event: Polyneuropathy

Prior to the event of polyneuropathy, the most recent dose of ipatasertib (300 mg) on Study Day 150 and paclitaxel on Study Day 157.

On Study Day 163, the patient was diagnosed with non-serious Grade 1 polyneuropathy. On Study Day 175, the event of polyneuropathy worsened to Grade 3. She received treatment with thioctic acid for polyneuropathy. The event of polyneuropathy remained unresolved at the time of study discontinuation.

Due to this event, there was no change in the study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose administered on Study Day 164.

The Investigator considered polyneuropathy to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 519, a radiographic response assessment showed disease progression with new lesion in right side of brain (cerebral hemisphere).

Study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 512. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy for brain (dose: 30 cGy; 10 fractions)	542	559

On Study Day 682, the patient was discontinued from the study as the study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	2	Non-serious	3	7	Related	Unrelated

1.7 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE≥3 DIARRHEA

Study Number/CRTN:	CO40016/305632	Patient number	1010
Demographics:	80-year-old American Indian or Alaska Native/White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was diagnosed with medullary, poorly differentiated, ER/PR negative and HER 2 negative, locally advanced unresectable recurrent, left breast cancer (T4bN0M0), on Study Day –94.

At screening, sites of disease involvement included external inferior quadrant of left breast.

No past cancer treatments were reported.

The patient′s medical history included genital prolapse. Surgical history included prolapse repair. Concurrent conditions included nephrolithiasis, hypothyroidism, and hypertension.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included levothyroxine and losartan.

On Study Day 5, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide. On Study Day 8, the event of diarrhea was considered resolved.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 10 and ipatasertib (400 mg) on Study Day 13.

On Study Day 14, the patient experienced non-serious Grade 3 diarrhea (10 stools per day) and Grade 2 abdominal pain (non-serious, related to ipatasertib). She received treatment with loperamide for diarrhea and hyoscine for abdominal pain. On Study Day 16, the event of diarrhea improved to Grade 1 (3-4 stools per day). On Study Day 17, stool analysis was negative for infection. On the following day (On Study Day 18), the events of diarrhea and abdominal pain were considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Unit: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	4
Diarrhea	24	PO	5	8
Diarrhea	4	PO	9	13
Diarrhea	24	PO	14	18
Diarrhea	4	PO	19	25
Diarrhea	24	PO	26	28
Diarrhea	4	PO	29	117

Due to this event, there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 14 and the next dose of ipatasertib was given at a reduced dose of 300 mg on Study Day 21.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 25, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). Treatment with loperamide was maintained. On Study Day 28, the event of diarrhea was considered resolved. Due to this event, study treatment with ipatasertib was further reduced to 200 mg on Study Day 34.

On Study Day 110, a radiographic response assessment showed disease progression with new lesion in right lung (segment III).

On Study Day 117, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 103 and ipatasertib on Study Day 109. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Gemcitabine and carboplatin	138	358
Capecitabine	358	Ongoing

On Study Day 1341, the patient was permanently discontinued from the study as per physician's decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Asthenia	2	Non-serious	5	8	Related	Unrelated
Nausea	1	Non-serious	13	14	Related	Unrelated
Urinary tract infection	2	Non-serious	33	40	Unrelated	Unrelated
Alopecia	1	Non-serious	36	454	Unrelated	Related
Vomiting	1	Non-serious	37	42	Related	Related
Nausea	1	Non-serious	37	52	Related	Related
Pharyngitis	2	Non-serious	53	72	Unrelated	Unrelated
Insomnia	2	Non-serious	93	Unresolved	Unrelated	Unrelated
Peripheral sensory neuropathy	1	Non-serious	99	102	Unrelated	Related
Pain in extremity	1	Non-serious	1221	Unknown	NA	NA

Study Number/CRTN:	CO40016/304191	Patient number	1012
Demographics:	63-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Diarrhea Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was diagnosed with poorly differentiated (histological subtype: not otherwise specified), ER/PR negative and HER 2-negative, locally advanced unresectable, right breast cancer (T4bN2M0) on Study Day −58.

At screening, sites of disease involvement included right mammary gland and right axillary lymph nodes.

No past cancer treatments were reported.

The patient′s medical history included calculus urinary, leukocyturia, peptic ulcer, cholelithiasis, cholecystitis chronic, goiter and chronic gastritis. Surgical history included nephrectomy (right kidney). Concurrent conditions included hypertension, myocardial ischemia, arteriosclerosis coronary artery, cardiac failure chronic, hydronephrosis, cyst (abdominal cavity), anxiety, electrolyte imbalance and hypercalcemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included losartan and amlodipine.

On Study Day 8, the patient experienced Grade 2 diarrhea (non-serious, related). No treatment was given for the event. On Study Day 17, the event of diarrhea was considered resolved.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 35 and ipatasertib (400 mg) on Study Day 39.

On Study Day 40, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. She received treatment with loperamide (2 mg, PO) and dietary advice was given. On Study Day 43, the event of diarrhea worsened to Grade 3. Dose of loperamide was increased to 6 mg. Later, on the same day (Study Day 43), the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	40	42
Diarrhea	6	PO	43	43
Diarrhea	2	PO	47	47
Diarrhea	4	PO	60	62
Diarrhea	6	PO	63	65
Diarrhea	4	PO	67	81
Diarrhea	2	PO	84	117
Diarrhea	2	PO	178	178
Diarrhea	2	PO	187	187

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	192	192

Due to this event, Cycle 2 Day 15 of paclitaxel was delayed and ipatasertib was interrupted on Study Day 42. The next dose of paclitaxel was given on Study Day 49 and ipatasertib at a reduced dose of 300 mg (due to an event of Grade 2 hyperglycemia; non-serious, related to ipatasertib, onset day: Study Day 15 and resolution day: Study Day 154) on Study Day 56.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 284, study treatment with ipatasertib and paclitaxel was permanently discontinued as per physician′s decision (patient has achieved complete response according to RECIST assessment and is planned to undergo radical mastectomy) with the last dose of paclitaxel given on Study Day 266 and ipatasertib on Study Day 272. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Right breast ″other″ surgery	299	NA
Doxorubicin and cyclophosphamide (4 cycles each)	342	445
Radiotherapy to postoperative breast zone and regional lymph nodes zone (dose: 96 cGy, 1 fraction)	492	533

On Study Day 779, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304778	Patient number	1079
Demographics:	64-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Hyperglycemia AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/307250	Patient number	1089
Demographics:	42 year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Diarrhea Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, lobular, moderately differentiated ER/PR and HER 2 negative right breast cancer (T3N3aM1), on Study Day –79 following right breast biopsy performed on the same day.

On Study Day –42, metastatic disease was confirmed with ER/PR and HER2 negative disease in metastatic tissue following right breast biopsy performed on the same day. At screening, sites of disease involvement included right breast lymph nodes and L3 bone.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included hypertension, seasonal allergy, bipolar disorder, ventricular extrasystoles and right bundle branch block.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included olmesartan, amlodipine, quetiapine, zolpidem, calcium carbonate/cholecalciferol/magnesium carbonate and denosumab.

On Study Day 3, the patient experienced Grade 1 intermittent nausea (non-serious, related). No treatment was given for this event. On the same day (Study Day 3), loperamide was given at a reduced dose of 2 mg (total daily dose).

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 4.

On Study Day 4, the patient experienced Grade 1 intermittent vomiting (non-serious, related). No treatment was given for this event. On Study Day 5, she experienced non-serious Grade 1 diarrhea. On Study Day 15, the event of diarrhea worsened to Grade 3. She received treatment with loperamide (details reported in the table below). On Study Day 16, the event of diarrhea was considered resolved. On Study Day 52, the events of nausea and vomiting were considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day

Due to this event, Cycle 1 Day 15 dose of paclitaxel was delayed and ipatasertib was interrupted on Study Day 15. The next dose of paclitaxel and ipatasertib was given on Study Day 22.

The Investigator considered diarrhea to be related to paclitaxel and ipatasertib.

On Study Day 148, the patient withdrew consent from the study treatment with the last dose of paclitaxel administered on Study Day 122 and ipatasertib on Study Day 128. The patient entered into the long-term follow-up.

On Study Day 241, an overall response assessment showed disease progression with new lesion in bilateral axillary lymph nodes and liver.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel (6 cycles)	323	371
Doxorubicin and cyclophosphamide (11 cycles)	385	644
Eribulin (7 cycles)	672	826
Vinorelbine (3 cycles)	854	882

On Study Day 896, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Study Number/CRTN:	CO40016/310604	Patient number	1094
Demographics:	35-year-old White Asian female		

Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort	Cohort A
Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, ER/PR and HER 2 negative left breast cancer (T3N1M1; histological grade unknown), on Study Day −47 following left breast biopsy performed on the same day.

On Study Day −23, metastatic disease was confirmed with ER/PR unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included left breast, left axillary lymph node and right lung multiple metastasis.

No past cancer treatments were reported.

The patient′s medical history included uterine leiomyoma and mastitis. Concurrent conditions included seasonal allergy, tumor pain and sensitive skin.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started receiving loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included loratadine, mucopolysaccharide polysulfuric acid ester and hydrocortisone.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 7.

On Study Day 2, the patient experienced Grade 1 nausea (non-serious, related to paclitaxel). She received treatment with metoclopramide. On Study Day 8, she experienced non-serious Grade 1 diarrhea with most extreme Grade 3 on Study Day 102. Grade changes for the event of diarrhea are mentioned in the table below. She received treatment with loperamide (for dosing details please refer to the treatment details table below), unspecified probiotics and polycarbophil calcium for diarrhea and further received treatment with rabeprazole for nausea. On Study Day 162, the event of nausea was considered resolved. On the following day (on Study Day 163), the event of diarrhea was considered resolved.

Due to this event, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 157 and the next dose was given on Study Day 160.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 162, an overall response assessment showed disease progression. Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 160 and ipatasertib given on Study Day 161. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Epirubicin, fluorouracil and cyclophosphamide (3 cycles each)	171	225
Bevacizumab and paclitaxel (2 cycles each)	247	281
Eribulin (3 cycles)	308	330
Atezolizumab and paclitaxel albumin (2 cycles each)	337	351

On Study Day 356, the patient died due to disease progression. An autopsy was not performed.

Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR and HER 2 negative locally advanced unresectable left breast cancer (T2N1M0), on Study Day −45. At screening, sites of disease involvement included lateral upper quadrant of left breast and left axillary lymph node.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent condition included gastritis.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Prior to event of Grade 3 diarrhea, the patient experienced multiple events of non-serious diarrhea (please refer to table below for details). She received treatment with loperamide (for detailed dosing please refer to table below). There was no change in the study treatments due to these events.

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	2	47	Related	Related
Diarrhea	1	Non-serious	57	78	Related	Related
Diarrhea	1	Non-serious	86	108	Related	Related
Diarrhea	2	Non-serious	129	129	Related	Related

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 127 and ipatasertib (400 mg) on Study Day 129.

On Study Day 130, the patient experienced non-serious Grade 3 diarrhea. On Study Day 131, the dose of ongoing loperamide was increased to 12 mg (total daily dose). On Study Day 132, the event of diarrhea improved to Grade 2 and was considered resolved on Study Day 133.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of Diarrhea	2	PO	2	13
Diarrhea	2	PO	16	18
Diarrhea	2	PO	20	21
Diarrhea	4	PO	29	31
Diarrhea	2	PO	32	32
Diarrhea	4	PO	33	35
Diarrhea	4	PO	37	38
Prophylaxis of Diarrhea	4	PO	40	40
Prophylaxis of Diarrhea	4	PO	43	46
Diarrhea	4	PO	48	49
Prophylaxis of Diarrhea	4	PO	57	67
Prophylaxis of Diarrhea	4	PO	69	77
Diarrhea	4	PO	85	95
Diarrhea	4	PO	97	110
Diarrhea	4	PO	113	130
Diarrhea	12	PO	131	131
Diarrhea	10	PO	132	133
Diarrhea	4	PO	141	142
Diarrhea	4	PO	147	148

There was no change in study treatment due to this event.

The Investigator considered diarrhea to be related to ipatasertib and paclitaxel.

On Study Day 144, an overall response assessment showed disease progression.

On Study Day 169, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 141 and ipatasertib on Study Day 147. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Surgery for a target lesion on left breast	179	NA
Radiotherapy of left breast (dose: 5000 cGy, 25 fractions)	229	NA
Capecitabine	291	Ongoing

On Study Day 732, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**

1.8 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE ≥ 2 COLITIS/ ENTEROCOLITIS

Study Number/CRTN:	CO40016/318540	Patient number	1188
Demographics:	33-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Colitis Grade ≥ 2 colitis/enterocolitis		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2-negative, metastatic left breast cancer (T2NXM1), on Study Day –57. At screening, sites of disease involvement included upper right lobe of lung, left axilla lymph node, bone (left rib and femoral diaphysis) and left breast.

No past cancer treatments were reported.

The patient′s medical history included non-Hodgkin′s lymphoma. Surgical history included cholecystectomy. Concurrent conditions included thyroid mass and gastritis.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications were ongoing at Study Day 1.

On Study Day 3, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide.

Event: Colitis

Prior to the event of colitis, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 15.

On Study Day 16, the patient experienced fever (body temperature not reported; approximately every 8 hours). Later, she took the scheduled dose of ipatasertib and 2 hours after the dose she experienced vomiting (non-serious; 3 episodes) and blood in stools (3 episodes). Subsequently, she was diagnosed with non-serious Grade 3 colitis (diagnostic test not reported). She received treatment with metoclopramide, ciprofloxacin, metronidazole and ibuprofen. Dietary advice was

also given. On the same day (Study Day 16), the event of diarrhea was considered resolved. On Study Day 17, a laboratory work-up showed RBC count 5×10^{12}/L, WBC count 4.7×10^{9}/L and platelet count was 361×10^{9}/L (normal ranges not reported). Stool culture showed common flora. On Study Day 19, the event of colitis was considered resolved.

Due to this event, there was no change in the study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 18 and the next dose was given at a reduced dose of 300 mg on Study Day 29.

The Investigator considered colitis to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 107, a radiographic assessment showed disease progression with new lesions in bone (multiple osteoblastic lesions in the spine, sacrum, iliac and femur).

On Study Day 113, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 99 and ipatasertib on Study Day 105. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine (8 cycles), pamidronate, anastrozole (1 cycle), leuprorelin, carboplatin and gemcitabine (unknown cycles)	122	Ongoing

On Study Day 446, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Flushing	1	Non-serious	2	3	Unrelated	Related
Pain in extremity	1	Non-serious	4	4	Unrelated	Related
Flushing	1	Non-serious	9	40	Unrelated	Related
Vomiting	1	Non-serious	13	13	Related	Unrelated
Diarrhea	1	Non-serious	19	24	Related	Unrelated
Erythema	1	Non-serious	28	Unresolved	Unrelated	Unrelated

Diarrhea	1	Non-serious	75	77	Related	Unrelated
Constipation	1	Non-serious	86	88	Unrelated	Unrelated

1.9 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE ≥ 3 RASH

Study Number/CRTN:	CO40016/304776	Patient number	1070
Demographics:	66-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Febrile neutropenia SAE		
Event 2 (PT) Categories:	Rash AE leading to study treatment discontinuation, Grade ≥ 3 rash		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/307234	Patient number	1071
Demographics:	66-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Rash Grade ≥ 3 rash		

The patient was randomized on Study Day −1.

The patient was diagnosed with ductal, ER/PR and HER-2 negative, metastatic right breast cancer (T2N1M1, histological grade unknown), on Study Day −85. At screening, sites of disease involvement included liver (right lobe), right breast and right axillary lymph node.

No past cancer treatment was reported.

The patient′s medical history included appendicitis. No surgical history was reported. Concurrent conditions included uterine leiomyoma and thyroid mass.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included loxoprofen, rebamipide and cefdinir.

Event: Rash (skin rash)

Prior to the event of rash, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 9.

On Study Day 10, the patient experienced non-serious Grade 1 (initial intensity) rash with redness and eczema around the left upper arm port construction site. She was started on treatment with betamethasone. On Study Day 11, she experienced rash on both upper limbs and medial thigh. On Study Day 13, the event of rash worsened to Grade 3 with skin eruption extended from the limbs to the neck. A skin biopsy was performed which revealed infiltration of inflammatory cells centered in lymphocytes and eosinophils in the superficial layer of the dermis. Epidermal individual cell necrosis was also observed, and it was concluded as drug rash. Virus tests result showed HSV IgG/EIA 26.5, HSV IGM/EIA 0.60 and mycoplasma/CF < 4 times. She further received treatment with difluprednate and fexofenadine. On Study Day 21, rash improved to Grade 2 and to Grade 1 on Study Day 27. On Study Day 41, the event of rash was considered resolved.

Due to this event, study treatment with paclitaxel was interrupted from Cycle 1 Day 8 and the next dose was given on Study Day 27 (Cycle 2 Day 1). Ipatasertib was initially interrupted on Study Day 12 and was resumed at a reduced dose of 300 mg on Study Day 34. On the same day (Study Day 34), the patient had accidental overdose (she took 300 mg ipatasertib at site and 300 mg at home) following which ipatasertib was again interrupted on Study Day 35. On Study Day 36, ipatasertib was resumed at a dose of 300 mg.

The Investigator considered rash to be related to paclitaxel and ipatasertib.

On Study Day 191, a radiographic response assessment showed disease progression. Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued with the last dose of paclitaxel given on Study Day 181 and ipatasertib on Study Day 189. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine (8 cycles)	223	391
Unspecified investigational drug	428	484
Bevacizumab (5 cycles)	813	979
Gimeracil/oteracil/tegafur	986	–

On Study Day 1049, the patient was permanently discontinued from the study as per physician's decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	2	13	Related	Related
Nausea	1	Non-serious	3	219	Unrelated	Related
Alopecia	2	Non-serious	14	Unresolved	Unrelated	Related
Diarrhea	1	Non-serious	43	196	Related	Related

1.10 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE ≥ 2 PNEUMONITIS

No patient experienced Grade ≥ 2 pneumonitis while in the study.

1.11 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE ≥ 3 HEPATOTOXICITY

Study Number/CRTN:	CO40016/304878	Patient number	1005
Demographics:	59-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Category:	Fracture SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/305632	Patient number	1017
Demographics:	41-year-old American Indian or Alaska Native and White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR and HER 2 negative, locally advanced unresectable right breast cancer (T4dN2M0) on Study Day −124. At screening, sites of disease involvement included external right quadrant of right breast and right armpit lymph node.

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included tumor pain and hypertriglyceridemia.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included tramadol, paracetamol, and atorvastatin.

Event: Alanine aminotransferase increased

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 29 and ipatasertib (400 mg) on Study Day 35.

On Study Day 36, a laboratory work-up showed ALT 178 U/L (normal range: 6-30 U/L) and AST 111 U/L (normal range: 9-31 U/L). The patient was diagnosed with non-serious Grade 3 alanine aminotransferase increased**,** and Grade 2 aspartate aminotransferase increased (non-serious, related). She was asymptomatic with no clinical jaundice and abdominal pain. No treatment was reported for these events. On Study Day 43, the event of alanine aminotransferase increased improved to Grade 2 and aspartate aminotransferase increased to Grade 1. On Study Day 64, the event of alanine aminotransferase increased further improved to Grade 1. On Study Day 78, the event of alanine aminotransferase increased worsened to Grade 2, which improved back to Grade 1 on Study Day 92. On Study Day 150, the events of alanine aminotransferase and aspartate aminotransferase increased were considered resolved.

Relevant lab values are listed in the table below:

Study Day	**AST** (normal range: 9-31 U/L)	**ALT** (normal range: 6-30 U/L)	**Total bilirubin** (normal range: 0.1-1 mg/dL)	**ALP** (normal range: 35-104 U/L)
Screening	57	57	0.87	118
28	107	118	1.05	144
36	111	178	1.32	197.5
43	57	110	1.55	181.2
50	71	132	1.15	185.9
64	39	75	1.04	143.6
78	71	114	1.24	146.3
92	61	60	1.35	116
106	52	78	1.4	150.8
120	41	43	1.21	138.8

Study Day	AST (normal range: 9-31 U/L)	ALT (normal range: 6-30 U/L)	Total bilirubin (normal range: 0.1-1 mg/dL)	ALP (normal range: 35-104 U/L)
150	45	52	1.86	176.2

Due to this event, Cycle 2 Day 8 of paclitaxel was delayed and ipatasertib was interrupted on Study Day 37. The next dose of paclitaxel and ipatasertib (at a reduced dose of 300 mg; reduction due to the event of aspartate aminotransferase increased) was given on Study Day 43.

The Investigator considered alanine aminotransferase increased to be related to ipatasertib and paclitaxel.

On Study Day 150, study treatment with paclitaxel and ipatasertib was permanently discontinued as per physician′s decision (two scans showed an increase in the target lesions although the increase did not exceed 20%) with the last dose of paclitaxel given on Study Day 134 and ipatasertib given on Study Day 140. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Gemcitabine and carboplatin (9 cycles each)	170	346
Other surgery of right breast	379	NA

On Study Day 1312, the patient was permanently discontinued from the study as per physician's decision (long term follow-up terminated by Sponsor).

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304638	Patient number	1058
Demographics:	39-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		

Event (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day 1.

The patient was initially diagnosed with poorly differentiated, ER/PR and HER 2 negative right breast cancer (T2N0M1; histological subtype not otherwise specified), on Study Day −45 following right breast biopsy performed on the same day.

On Study Day −35, metastatic disease was confirmed with ER/PR and HER 2-negative in metastatic tissue. At screening, sites of disease involvement included lungs (left subpleural and lateral 8th right segment), bone (multiple) and liver (segments 4/A and 7th).

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included metastases to bone, abdominal pain upper, hepatic enzyme increased, neck pain and headache.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included nimesulide, calcium carbonate/cholecalciferol and zoledronic acid.

Event: Alanine aminotransferase increased (ALT elevation)

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 6.

On Study Day 7, a laboratory work-up showed AST 100 U/L (normal range: 0-31 U/L) and ALT 186 U/L (normal range: 0-31 U/L) and the patient was diagnosed with Grade 2 aspartate aminotransferase increased (non-serious, related to ipatasertib) and non-serious Grade 3 alanine aminotransferase increased. She had ongoing condition of Grade 1 hepatic enzyme increased. No treatment was reported for these events. On Study Day 14, the event of aspartate aminotransferase increased improved to Grade 1 and alanine aminotransferase increased improved to Grade 2. Relevant laboratory values are reported in the table below. On Study Day 21, the event of aspartate aminotransferase increased again worsened to Grade 2. On Study Day 28. the event of aspartate aminotransferase increased improved to Grade 1 and on Study Day 35, the event of alanine aminotransferase increased improved to Grade 1. The events of alanine aminotransferase increased, and aspartate aminotransferase increased remained unresolved at the time of patient′s death.

Relevant lab values are listed in the table below:

Study Day	AST (normal range: 0-31 U/L)	ALT (normal range: 0-31 U/L)	ALP (normal range: 35-104 U/L)	Bilirubin (normal range: 0-21 μmol/L)
Screening	61	68	138	11.3
1	70	70	156	10.8
7	100	186	152	10.4
14	69	125	153	8.3
21	96	108	311	4.9
28	70	115	216	12.8
35	54	75	189	5.9
42	56	70	297	5.6
67	91	98	321	9.0

There was no change in study treatment due to this event.

The Investigator considered alanine aminotransferase increased to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 55, an overall response assessment showed disease progression.

On Study Day 67, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 43 and ipatasertib on Study Day 49. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy: whole brain irradiation and to bone (cervical I-II vertebrae) (dose: 3000 cGy, 10 fractions each)	68	81
Radiotherapy to bone: lumbar IV vertebra (dose: 2000 cGy, 5 fractions)	75	81
Cyclophosphamide, methotrexate and fluorouracil (1 cycle each)	83	90
Unspecified palliative surgery of small intestine	113	NA
Talazoparib	142	260
Radiotherapy to lymph nodes: left side of the neck (dose: 3000 cGy, 10 fractions)	231	245
Cisplatin (1 cycle)	284	284

On Study Day 294, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Vomiting	1	Non-serious	5	5	Related	Related
Diarrhea	1	Non-serious	5	5	Related	Unrelated

Study Number/CRTN:	CO40016/304641	Patient number	1075
Demographics:	75-year old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/307253	Patient number	1116
Demographics:	38-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Gamma-glutamyltransferase increased Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR and HER 2 negative left breast cancer (T1N0M0), on Study Day −880.

On Study Day −63, the patient was diagnosed with metastatic disease with ER/PR and HER 2-negative disease in metastatic tissue. At screening, sites of disease involvement included posterior left cervical and supraclavicular lymph node and pericardial effusion.

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Surgery	Curative	Left simple mastectomy	−814	NA
Cancer therapy	Adjuvant	Epirubicin, cyclophosphamide and docetaxel (4 cycles each)	Approximately 1 year and 10 months prior to study entry	Approximately 1 year and 10 months prior to study entry

No medical or surgical history was reported. Concurrent conditions included hepatic steatosis and cancer pain.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included loxoprofen.

Event 1: Alanine aminotransferase increased (ALT increased)
Event 2: Gamma-glutamyltransferase increased (GGT increased)

Prior to the events of alanine aminotransferase and gamma-glutamyl transferase increased, the most recent dose of paclitaxel was administered on Study Day 14 and ipatasertib (400 mg) on Study Day 22.

On Study Day 27, a laboratory work-up showed ALT 59 U/L (normal range: 7-23 U/L), AST 42 U/L (normal range: 13-30 U/L), ALP 556 U/L (normal range: 106-322 U/L), and GGT 413 U/L (normal range: 9-32 U/L). The patient was diagnosed with non-serious Grade 1 (initial intensity) alanine aminotransferase increased and Grade 3 (initial intensity) gamma-glutamyl transferase increased, Grade 1 aspartate aminotransferase increased, and Grade 1 blood alkaline phosphatase increased (both non-serious, related). On Study Day 41, the patient was noted with Grade 1 blood bilirubin increased with total bilirubin 1.6 mg/dL (normal range: 0.4-1.5 mg/dL; non-serious, related). No treatment was given for these events. On Study Day 48, the event of blood bilirubin increased was considered resolved. On Study Day 83, the event of alanine aminotransferase increased worsened to Grade 3. On Study Day 195, the event of gamma-glutamyl transferase increased worsened to Grade 4 with GGT 648 U/L (normal range: 9-32 U/L). Grade changes for alanine aminotransferase and gamma-glutamyl transferase increased are listed in the table below. The events of aspartate aminotransferase increased, alkaline phosphatase increased, alanine aminotransferase increased and gamma-glutamyl transferase increased remained unresolved at the time of patient's death.

Grade changes:

Study Day	Grade changes for alanine aminotransferase increased	Grade changes for gamma-glutamyltransferase increased
48	2	—
83	3	—
91	2	—
97	1	—
139	2	—
195	—	4
203	—	3

Relevant lab values are listed in the table below:

Study Day	AST (normal range: 13-30 U/L)	ALT (normal range: 7-23 U/L)	ALP (normal range: 106-322 U/L)	Bilirubin (normal range: 0.4-1.5 mg/dL)
Screening	35	54	352	1.3
14	27	33	237	0.6
27	42	59	556	0.7
35	32	46	432	0.9
41	40	49	326	1.6
48	64	99	405	1.3

Study Day	AST (normal range: 13-30 U/L)	ALT (normal range: 7-23 U/L)	ALP (normal range: 106-322 U/L)	Bilirubin (normal range: 0.4-1.5 mg/dL)
55	39	68	348	1.1
69	62	84	456	0.9

91	–	78	–	–
97	38	57	417	1.4
104	40	56	383	1.5
111	36	58	337	1.0
139	53	86	545	0.9
167	46	64	376	0.8
195	52	79	519	0.8
217	42	47	414	1.2

There was no change in study treatment due to the event of gamma-glutamyltransferase increased.

Due to the event of alanine aminotransferase increased, study treatment with paclitaxel was reduced to 65 mg/m^2 and ipatasertib was reduced to 300 mg on Study Day 98.

The Investigator considered alanine aminotransferase increased to be related to ipatasertib and paclitaxel.

The Investigator considered gamma-glutamyltransferase increased to be unrelated to ipatasertib and paclitaxel and related to concurrent illness (hepatic steatosis).

On Study Day 196, an overall response assessment showed disease progression with new lesion in brain (left cerebellum).

On Study Day 203, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 181 and ipatasertib on Study Day 189. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to brain (cyber knife) (dose: 2000 cGy, 1 fraction)	217	217
Eribulin (3 cycles)	238	301
Capecitabine	315	428
Radiotherapy to neck (dose: unknown, 10 fractions)	380	393
Bevacizumab and paclitaxel	479	581
Radiotherapy to brain (dose: unknown, 7 fractions)	617	623

On Study Day 631, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Accidental overdose	Not reported	Non-serious	1	1	Not reported	Not reported
Upper respiratory tract Infection	2	Non-serious	3	5	Unrelated	Unrelated
Diarrhea	2	Non-serious	5	Unresolved	Related	Unrelated
Rash	2	Non-serious	25	Unresolved	Related	Related
Stomatitis	2	Non-serious	28	Unresolved	Related	Related
Upper respiratory tract Infection	2	Non-serious	154	217	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305634	Patient number	1169
Demographics:	57-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event (PT) Category:	Aspartate aminotransferase increased Grade $\geq$ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR and HER 2 negative right breast cancer (T2N1aM0; histological grade unknown), on Study Day −918.

On Study Day −50, the patient was diagnosed with locally recurrent, metastatic disease with ER/PR and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included lymph nodes (right supraclavicular, pectoral and midline adjacent to superior vena cava).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin, cyclophosphamide (4 cycles each) and paclitaxel (12 cycles)	−866	−744
Surgery	Curative	Right modified radical mastectomy	−694	NA
Radiotherapy	Adjuvant	Right chest wall (dose unknown; 25 fractions)	−660	−626

No medical or surgical history was reported. Concurrent condition included hypertension.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event: Aspartate aminotransferase increased (AST elevation)

Prior to the event of aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 7.

On Study Day 8, a laboratory work-up showed ALT 168 U/L (normal range: 0-55 U/L) and AST 218 U/L (normal range: 5-34 U/L) and she was diagnosed with Grade 2 alanine aminotransferase increased (initial intensity Grade 1) (non-serious, unrelated) and non-serious Grade 3 aspartate aminotransferase increased. No treatment was given for these events. On Study Day 29, the events of alanine aminotransferase increased, and aspartate aminotransferase increased were considered resolved.

Relevant lab values are listed in the table below:

Study Day	AST (normal range: 5-34 U/L)	ALT (normal range: 0-55 U/L)	Bilirubin (normal range: 0.2-1.2 mg/dL)	ALP (normal range: 40-150 U/L)
Screening	21	24	0.48	95
1	19	21	0.44	94
8	218	168	0.92	142
15	211	154	0.83	185
29	18	31	0.44	117

There was no change in study treatment due to this event.

The Investigator considered aspartate aminotransferase increased to be unrelated to ipatasertib and paclitaxel and related to disease under study.

On Study Day 231, an overall response assessment showed disease progression with new lesion in right supraclavicular lymph node.

On Study Day 245, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 239 and ipatasertib on Study Day 245. The patient entered into the long-term follow-up.

On Study Day 573, the patient died due to unknown cause. It was unknown if an autopsy was performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	58	67	Unrelated	Unrelated
Neuropathy peripheral	1	Non-serious	84	Unresolved	Unrelated	Unrelated
Lymphoedema	1	Non-serious	84	Unresolved	Unrelated	Unrelated

Study Number/CRTN:	CO40016/318146	Patient number	1195
Demographics:	48-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort A		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade $\geq$ 3 hepatotoxicity		
Event 2 (PT) Category:	Gamma-glutamyl transferase increased Grade $\geq$ 3 hepatotoxicity		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with moderately differentiated, ER/PR and HER 2-negative bilateral breast cancer (T3N2M1; histological subtype: other), on Study Day −61.

On Study Day −59, metastatic disease was confirmed with ER/PR and HER 2-negative disease in metastatic tissue. At screening, sites of disease involvement included bilateral lung and breast nodules, bilateral armpit lymph nodes and pulmonary hilum lymph nodes.

No past cancer treatments were reported.

The patient′s medical history included cholelithiasis. No surgical history and concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications were ongoing at Study Day 1.

Event 1: Alanine aminotransferase increased (increased alanine aminotransaminase)
Event 2: Gamma glutamyltransferase increased (increased gamma-glutamyl transferase)

Prior to the events of alanine aminotransferase increased and gamma glutamyl transferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 6.

On Study Day 7, the patient was noted to have Grade 3 alanine aminotransferase increased (ALT 606.1 U/L; normal range: 0-41 U/L) and Grade 3 gamma glutamyltransferase increased (GGT on Study Day 8: 246 U/L; normal range: 5-35 U/L). No treatment was reported for these events. On Study Day 15, the event of alanine aminotransferase increased was considered resolved. On Study Day 16, the event of gamma glutamyltransferase increased improved to Grade 2 (GGT: 149 U/L). On Study Day 34, the event of gamma glutamyltransferase increased was considered resolved.

Relevant lab values are listed in the table below:

Study Day	**AST** (normal range: 0-40 U/L)	**ALT** (normal range: 0-41 U/L)	**ALP** (normal range: 40-129 U/L)	**Bilirubin** (normal range: 0-1.2 mg/dL)
Screening	19.4	25.4	95.6	0.4
7	118.2	606.1	178.7	0.4
8	66	438	166	Not done
16	20.9	70.9	112.9	0.2
28	26.2	41.6	107.2	0.3
35	22.5	46	106.5	0.4

There was no change in study treatment due to these events.

The Investigator considered alanine aminotransferase increased and gamma glutamyl transferase increased to be related to ipatasertib and paclitaxel.

On Study Day 52, an overall response assessment showed disease progression with new lesion in mediastinal lymph node.

On Study Day 85, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 71 and ipatasertib on Study Day 79. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Doxorubicin and cyclophosphamide (4 cycles each)	94	Ongoing
Radiotherapy to brain (dose unknown; 10 fractions)	105	120

On Study Day 396, the patient died due to an unknown cause. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	2	Non-serious	1	4	Unrelated	Unrelated
Neuropathy peripheral	1	Non-serious	2	3	Unrelated	Related

TABLE OF CONTENTS

1. NARRATIVES

1.1 NARRATIVES FOR PATIENTS WHO DIED DUE TO ADVERSE EVENT(S)

Study Number/CRTN:	CO40016/305629	Patient number	2008
Demographics:	76-year-old American Indian or Alaska native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Categories:	Diarrhea SAE, AESI: Grade $\geq$ 3 diarrhea		
Event 2 (PT) Categories:	Hyperglycemia SAE, AE leading to study treatment discontinuation, AESI: Grade $\geq$ 3 hyperglycemia		
Event 3 (PT) Category:	Dehydration SAE		
Event 4 (PT) Category:	Hypoglycemia SAE		
Event 5 (PT) Categories:	Respiratory distress Death due to AE, SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal and other unspecified subtype (NOS), moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T4bN1M0), approximately 5 years prior to study entry.

The patient was diagnosed with metastatic disease, approximately 1 year and 4 months prior to study entry with ER/PR unknown and HER2 was not assessed in metastatic tissue.

At screening, sites of disease included liver (lateral edge and medial border of segment VI), right upper breast and chest (upper trachea), lung (bilateral nodules), pelvis (bilateral adenopathy of obturator groups), bone (blastic lesions at right costal, lumbar 5th, sacrum and left iliac) and retroperitoneal lymph node. The patient was assessed by the Investigator to have endocrine resistant disease and visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Cyclophosphamide, doxorubicin, and paclitaxel	Approximately 5 years prior to study entry	Approximately 4 years and 7 months prior to study entry
Surgery	Curative	Left modified radical mastectomy	Approximately 4 years and 6 months prior to study entry	—
Radiotherapy	Adjuvant	Left breast (total dose: 4500 cGy)	Approximately 4 years and 6 months prior to study entry	Approximately 4 years and 4 months prior to study entry
Cancer therapy	Adjuvant	Anastrozole	Approximately 4 years and 6 months prior to study entry	−512
Cancer therapy	Metastatic	Exemestane	−512	−92

No medical or other surgical history was reported. The patient′s concurrent conditions included Parkinson′s disease, and left ilium fracture.

At screening, the patient′s ECOG Performance Status was 1. Her vitals showed pulse rate 100 beats/min, respiratory rate 19 breaths/min and blood pressure 100/60 mmHg.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medication ongoing at Study Day 1 included zoledronic acid.

The patient was noted with Grade 2 hyperglycemia (non-serious, related to ipatasertib) from Study Days 8-11 for which ipatasertib was interrupted until levels resolved to Grade 1 and she received metformin (425 mg, PO, BID). She experienced Grade 1 diarrhea (non-serious, related to ipatasertib) from Study Days 12-16. Treatment with loperamide was maintained at 4 mg total daily dose. She also had an episode of Grade 1 hyperglycemia (non-serious, related to ipatasertib; glucose 139 mg/dL) from Study Days 14-18, for which metformin was continued but at an increased dose of 425 mg, PO, TID from Study Day 16 until Study Day 29 (patient was non-compliant). Relevant laboratory values are reported in the table below.

Event 1: Diarrhea
Event 2: Hyperglycemia

Event 3: Dehydration
Event 4: Hypoglycemia

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 29 and ipatasertib (400 mg) on Study Day 34.

Prior to the events of hyperglycemia, dehydration and hypoglycemia, the most recent dose of paclitaxel was administered on Study Day 29 and ipatasertib on Study Day 40.

On Study Day 40, the patient attended clinic in preparation for her Cycle 2 Day 8 visit and was noted with dehydration and diarrhea (started on Study Day 35, Grade 3, treatment with loperamide maintained at 4 mg). Laboratory work-up showed fasting glucose level at 411 mg/dL (normal range: 70-110 mg/dL) and the patient was diagnosed with Grade 3 hyperglycemia. On Study Day 41, the patient presented with persisting Grade 3 diarrhea, and she was also diagnosed with Grade 3 dehydration. She was hospitalized for management of diarrhea, hyperglycemia and dehydration. Stool examination showed presence of yeasts. She received treatment with insulin, ceftriaxone, sodium chloride and ranitidine, and was given dietary and hydration advice. After treatment with insulin, glucose value was noted to be 279 mg/dL, and the event of hyperglycemia was considered to have improved to Grade 2. Later, the same day (Study Day 41), the event of hyperglycemia was considered resolved. On Study Day 42, loperamide dose was increased to 8 mg. The same day (Study Day 42), the event of dehydration was considered resolved.

On Study Day 43, the patient was noted with Grade 2 hypoglycemia (glucose 60 mg/dL) leading to prolongation of hospitalization. No treatment was reported for this event. On Study Day 44, the event of diarrhea was considered resolved. Hypoglycemia resolved on the following day (Study Day 45). Treatment with loperamide was stopped and the patient was given dietary and hydration advice. On Study Day 46, she was discharged from the hospital.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of Diarrhea	4	PO	1	42
Diarrhea	8	PO	42	46

Hyperglycemia treatment details:

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Metformin	Hyperglycemia	425	PO	BID	8	16
Metformin	Hyperglycemia	425	PO	TID	16	29
Ranitidine	Hyperglycemia	50	IV	TID	41	42

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Insulin	Hyperglycemia	20*	SC	PRN	41	41
Ceftriaxone	Hyperglycemia and diarrhea	2	IV	QD	42	45
Ranitidine	Hyperglycemia	300	PO	QD	43	Ongoing

*Units: IU

Relevant laboratory work-up:

Study Day	Glucose Normal range: 70-110 mg/dL)	HbA1c Normal range: 2-6%	Sodium Normal range: 133-145 mEq/L	Potassium Normal range: 3.3-5.1 mEq/L
Screening	80	5.8	140	4.18
8	210	—	135.1	4.17
11	98	—	—	—
14	139	—	138	3.7
18	78	—	—	—
40	411	—	132	3.7
41	279	—	—	—
42	86	—	—	—
43	60	—	—	—
44	70	—	—	—
45	77	—	—	—
46	70	—	—	—

Due to the events of diarrhea, dehydration and hypoglycemia, study treatment with ipatasertib and paclitaxel was interrupted; however, due to the event of hyperglycemia, study treatment was permanently discontinued with the last dose of paclitaxel administered on Study Day 29 and ipatasertib on Study Day 40.

The Investigator considered diarrhea and hyperglycemia to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered dehydration to be unrelated to ipatasertib and paclitaxel and related to other unspecified cause.

The Investigator considered hypoglycemia to be unrelated to ipatasertib and paclitaxel and related to other cause (antidiabetic treatment given during hospitalization).

Event 5: Respiratory distress

Prior to the event of respiratory distress, study treatment had already been discontinued.

On Study Day 54, the patient developed respiratory distress with cough and vomiting. Her condition worsened, and she was transferred to the hospital nearby. Reportedly, she did not have any problems until Study Day 53 after getting discharged on Study Day 46. No treatment was reported for the event. The same day (Study Day 54), she died due to respiratory distress. It was unknown whether an autopsy was performed or not. Details regarding death certificate were not available.

The Investigator considered respiratory distress to be unrelated to ipatasertib and paclitaxel and related to disease under study.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Alopecia	2	Non-serious	20	Unresolved	Unrelated	Related
Mucosal inflammation	1	Non-serious	41	46	Unrelated	Related
Rash maculo-papular	2	Non-serious	42	46	Unrelated	Unrelated

Study Number/CRTN:	CO40016/310803	Patient number	2033
Demographics:	76-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Categories:	Death Death due to AE, SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with lobular, moderately differentiated, ER/PR positive and HER2 negative locally advanced unresectable right breast cancer (T4N3M0) on Study Day −56.

At screening sites of disease involvement included right breast (middle), and lymph nodes (right supraclavicular and axillary).

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included hypertension, pulmonary fibrosis (diffuse basal pneumosclerosis and lung root fibrosis), endometrial hyperplasia, uterine leiomyoma, cholelithiasis, supraventricular extrasystoles, left ventricular hypertrophy, aortic arteriosclerosis, aortic valve sclerosis, mitral valve sclerosis, pericardial effusion, proteinuria, glycosuria, blood calcium increased, serum ferritin increased, glycosylated hemoglobin increased, hepatomegaly, pancreatic steatosis, hyperplasia adrenal, pyelocaliectasis and renal cyst.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included indapamide.

Event: Death (Unexplained death)

Prior to death, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 20.

On Study Day 21, the patient died. The cause of death remained unexplained. It was reported that disease under study could not be a cause of death as the patient had a good response to the treatment on last visits. An autopsy was performed. Note from the local pathology department reported acute pneumonia as the cause of death; however, this was not considered appropriate by the investigator because no clinical signs, elevated body temperature or CT-scan results were reported, which could detect pneumonia. According to the investigator, pneumonia as a cause of death was mentioned by default and was without any evidence.

The patient received the last dose of paclitaxel on Study Day 15 and ipatasertib on Study Day 21.

The Investigator considered death to be unrelated to paclitaxel and ipatasertib and related to other cause (unspecified).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	2	Non-serious	5	6	Related	Unrelated
Nausea	1	Non-serious	7	7	Unrelated	Related
Diarrhea	1	Non-serious	9	9	Related	Unrelated
Nausea	1	Non-serious	11	14	Unrelated	Related

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Blood lactate dehydrogenase increased	1	Non-serious	15	21	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305250	Patient number	2078
Demographics:	66-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Categories:	Road traffic accident Death due to AE, SAE		
Event 2 (PT) Categories:	General physical health deterioration Death due to AE, SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, left breast cancer (T1cN1M0; histological grade unknown), approximately 25 years prior to study entry followed by left lumpectomy and axillary lymph node dissection. ER and PR status was unknown and HER2 status was not assessed.

The patient was diagnosed with locally recurrent disease followed by left radical mastectomy approximately 20 years prior to study entry. On Study Day –341, the patient was diagnosed with metastatic disease (ER positive, PR negative and HER2 negative in recurrent/metastatic tissue). At screening sites of disease involvement included liver (segment III). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Vindesine, cyclophosphamide, epirubicin, fluorouracil and tamoxifen	Approximately 24 years prior to study entry	Approximately 24 years prior to study entry

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Breast, internal mammal chain and supraclavicular fossa (4500 cGy; fractions not reported)	Approximately 24 years prior to study entry	Approximately 24 years prior to study entry
Cancer therapy	Adjuvant	Epirubicin	Approximately 19 years prior to study entry	Approximately 19 years prior to study entry
Cancer therapy	Adjuvant	Exemestane and letrozole	Approximately 6 years prior to study entry	Approximately 4 years prior to study entry
Cancer therapy	Adjuvant	Anastrozole, docetaxel and cyclophosphamide	Approximately 4 years and 4 months prior to study entry	Approximately 3 years and 10 months prior to study entry
Cancer therapy	Metastatic	Exemestane and everolimus	−331	−228
Cancer therapy	Metastatic	Palbociclib and fulvestrant	−228	−24
Surgery	Curative	Left axillary lymph node dissection	−156	NA

The patient′s medical history included hiatus hernia and intervertebral disc protrusion. Other surgical history included hysterectomy. Concurrent conditions included sinus tachycardia, retinal disorder and lymphedema.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bisoprolol, calcium carbonate and docosahexaenoic acid/eicosapentaenoic acid.

On Study Day 392, radiographic response assessment showed disease progression.

On the same day (Study Day 392), study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 365 and Study Day 385, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Pegylated liposomal doxorubicin	399	399

Event 1: Road traffic accident (Deterioration of general condition due to car accident)
Event 2: General physical health deterioration (Deterioration of general condition due to car accident)

Prior to the events of road traffic accident and general physical health deterioration, study treatment had been already discontinued.

On Study Day 410, the patient died due to general physical health deterioration following road traffic accident. No treatment and diagnostic tests were reported. An autopsy was not performed.

The Investigator considered road traffic accident and general physical health deterioration to be unrelated to ipatasertib and paclitaxel and related to other causes.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305637	Patient number	2161
Demographics:	59-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Neutropenia SAE		
Event 2 (PT) Categories:	Febrile neutropenia Death due to AE, SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER, PR positive and HER2 negative right breast cancer (T1N1M0), approximately 3 years and 5 months prior to study entry.

On Study Day −34, the patient was diagnosed with metastatic disease (ER and PR status was unknown and HER2 status was not assessed in metastatic tissue). At screening sites of disease involvement included liver (segments IV and VII), lung (apical lobe) and bone (bilateral axial skeleton; multiple lesions). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy and axillary lymph node dissection	Approximately 3 years and 3 months prior to study entry	NA
Cancer therapy	Adjuvant	Cyclophosphamide, epirubicin and fluorouracil	Approximately 3 years and 2 months prior to study entry	−703
Cancer therapy	Adjuvant	Docetaxel	Approximately 2 years and 11 months prior to study entry	Approximately 2 years and 9 months prior to study entry

No medical and other surgical history was reported. Concurrent condition included back pain, hypercholesterolemia, and hypertriglyceridemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included paracetamol and bezafibrate.

Event 1: Neutropenia
Event 2: Febrile neutropenia (Neutropenic fever)

Prior to the events of neutropenia and febrile neutropenia, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib on Study Day 13.

On Study Day 14, a laboratory work-up for Cycle 1 Day 15 dose of paclitaxel showed Grade 4 neutropenia (neutrophil count $0.09 \times 10^3/\mu L$; normal range: $1.69\text{-}7.16 \times 10^3/\mu L$). The patient was asymptomatic. Treatment for the event included filgrastim.

Due to the event of neutropenia, study treatment with paclitaxel and ipatasertib was interrupted after Study Day 8 and Study Day 14, respectively.

On Study Day 22, the patient presented with fever (body temperature not reported) and she was assessed to have Grade 4 (initial intensity) febrile neutropenia, leading to hospitalization. She received unspecified antibiotics. On an unspecified day, she experienced nausea, vomiting and fatigue. Reportedly, neutrophil levels did not increase even after continuous treatment with filgrastim and the patient did not respond to antibiotics treatment and continued having fever. A specific source of infection was unknown. On Study Day 28, the patient died due to febrile neutropenia. It was reported that she had detrimental functional status with sepsis (blood culture not reported) that evolved to septic shock and finally led to death, which was related to neutropenia. An autopsy was not performed.

The patient received the last dose of paclitaxel on Study Day 8 and ipatasertib on Study Day 14.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: $4.1\text{-}12.6 \times 10^3/\mu L$	**Neutrophil count** Normal range: $1.69\text{-}7.16 \times 10^3/\mu L$	**Body temperature** °C
Screening	14.43	11.52	—
	—	—	36.5
8	3.48	2.48	36.9
14	0.52	0.09	—

The Investigator considered neutropenia and febrile neutropenia to be related to ipatasertib and paclitaxel.

Other AE experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Hyperbilirubinemia	1	Non-serious	1	27	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305649	Patient number	2208
Demographics:	58-year-old female (race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Pleural effusion SAE		
Event 2 (PT) Category:	Lower respiratory tract infection SAE		
Event 3 (PT) Categories:	Pneumonia Death due to AE, SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER positive, PR and HER2 negative right breast cancer (T4bN1M0) on Study Day -722.

On Study Day -48, the patient was diagnosed with metastatic disease with ER positive, PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease included lung (left lung lingula), bone (sternal, parietal region, vertebral column D11, D5, D3 and L5; third medium of right radius, 9th and 10th right costal arch), lymph nodes (left axillary, prevascular and pretracheal), pleura (ipsilateral left pleural effusion and paramedian left pleural grease) and soft tissue (right pre and retro sternal space with extension to subcutaneous tissue and skin). The patient was assessed by the Investigator to have endocrine resistant disease and visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin and cyclophosphamide	-613	-541
Cancer therapy	Neo-adjuvant	Paclitaxel	-519	-430
Surgery	Curative	Right modified radical mastectomy and axillary lymph node dissection	-358	NA
Radiotherapy	Adjuvant	Right breast, axillary and supraclavicular lymph nodes (total dose: 5000 cGy; 25 fractions)	-324	-287
Cancer therapy	Adjuvant	Anastrozole	-324	-83

The patient′s medical history included chronic gastritis. No other surgical history was reported. Concurrent conditions included cough, dyspnea, cardiac failure, hypertension, hepatic steatosis, and back pain.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included irbesartan, carvedilol, hydrochlorothiazide, and spironolactone.

On Study Day 9, the patient experienced Grade 2 diarrhea infectious and dehydration (both non-serious, unrelated). On Study Day 10, she was noted to have Grade 2 worsening hypertension (non-serious, unrelated, blood pressure value not provided for this day). She received treatment with irbesartan and carvedilol for hypertension; loperamide and ondansetron for diarrhea and sodium chloride and unspecified electrolytes for dehydration. Dehydration resolved on the same day (Study Day 10). On Study Day 13, she was diagnosed with Grade 2 dehydration and Grade 3 hypokalemia (both non-serious, unrelated and relevant laboratory values not provided for this day). On the same day (Study Day 13), her blood pressure was 150/80 mmHg. She received treatment with sodium chloride, glucose and unspecified electrolytes for dehydration and potassium chloride for hypokalemia and metamizole, ceftriaxone and amikacin for diarrhea.

Event 1: Pleural effusion

Prior to the event of pleural effusion, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 14.

On Study Day 15, the patient presented with ongoing dyspnea. A chest X-ray and an ultrasound showed Grade 2 pleural effusion. Subsequently, she was hospitalized, and thoracentesis was

performed. It was reported that fluid overload due to the management of hypertension and hypokalemia was considered as antecedent of class I heart failure. She received treatment with isosorbide dinitrate, spironolactone, potassium citrate and furosemide. On Study Day 16, dehydration was considered resolved. On Study Day 17, diarrhea infectious resolved. The event of hypokalemia resolved on Study Day 18. On Study Day 19, pleural effusion was considered as resolved, and the patient was discharged from the hospital. At the time of discharge, the patient had Grade 1 dyspnea, however, it was ongoing prior to study start and was considered as a symptom of disease under study. She further received treatment with captopril and on Study Day 34, worsening hypertension was considered as resolved.

There was no change in the study treatment due to the event of pleural effusion.

The Investigator considered pleural effusion to be unrelated to ipatasertib and paclitaxel and related to disease under study, concurrent illness and other causes.

Event 2: Lower respiratory tract infection (Infection of low respiratory routes)

Prior to the event of lower respiratory tract infection, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 22.

On Study Day 23, the patient presented to the hospital with dyspnea. Chest X-ray results were suggestive of inflammatory process; however, surgeons discarded the suspicion, and diagnosis of Grade 2 lower respiratory tract infection was established. Subsequently, she was hospitalized due to persistent symptoms. She received treatment with ceftriaxone, ciprofloxacin, meropenem, vancomycin, trimethoprim/sulfamethoxazole and prednisone. On Study Day 40, the event of lower respiratory tract infection was considered as resolved and the patient was discharged from the hospital.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4.5-11 $\times 10^9$/L	**Absolute neutrophil count** Normal range: 0-0.5 $\times 10^9$/L	**Absolute lymphcyte count** Normal range: 1-4.8 $\times 10^9$/L
Screening	9.16	7.79	0.82
22	14.03	12.49	0.84
25	3.88	3.53	0.08
34	15.1	13.59	0.75
40	17.49	12.59	1.22
48	13.34	10.27	1.57
49	14.54	11.92	1.31
51	15.82	14.55	0.79
54	12.16	10.95	0.73

Due to the event of lower respiratory tract infection, study treatment with paclitaxel and ipatasertib was interrupted after Study Day 22.

The Investigator considered lower respiratory tract infection to be unrelated to ipatasertib and paclitaxel and related to disease under study, concurrent illness and other causes.

Event 3: Pneumonia (Hospital-acquired pneumonia)

Prior to the event of pneumonia, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 22.

On Study Day 48, the patient presented to the hospital with cough with green expectoration and increased dyspnea. A chest tomography revealed consolidation and pleural effusion and the patient was hospitalized with Grade 2 pneumonia. Sputum culture was positive for *Staphylococcus aureus* and the event was reassessed as hospital-acquired pneumonia. She received treatment with meropenem and vancomycin. On Study Day 59, she was diagnosed with decompensated intrahepatic cholangiocarcinoma and cardiorenal failure (symptoms and diagnostic details not provided).

Due to the event of pneumonia, study treatment was permanently discontinued with the last dose of paclitaxel and ipatasertib administered on Study Day 22.

On Study Day 60, the patient was hypotensive (blood pressure not provided) and in pain. On the same day, at 13:10 hours, the patient died due to hospital-acquired pneumonia. Cardiogenic shock due to myocardial infarction was also considered one of the cause of death, however no autopsy was performed to confirm the final cause; thus hospital-acquired pneumonia was considered the primary cause of death.

The Investigator considered pneumonia to be unrelated to ipatasertib and paclitaxel and related to other cause.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

1.2 NARRATIVES FOR PATIENTS WHO DIED DUE TO DISEASE PROGRESSION

Study Number/CRTN:	CO40016/304193	Patient number	2005
Demographics:	62-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Alanine aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity		

Event 2 (PT) Category:	Aspartate aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity
Additional category:	Death due to disease progression

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal and lobular, moderately differentiated, ER positive/PR status unknown and HER2 negative left breast cancer (T2N3M0), approximately 3 years 5 months prior to study entry following left breast biopsy.

On Study Day −79, the patient was diagnosed with metastatic disease with ER positive/PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included liver (multiple lesions including segments 3 and 6) and bone (multiple). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	″Other″ (site: left breast)	Approximately 3 years 4 months prior to study entry	NA
Cancer therapy	Adjuvant	Docetaxel and doxorubicin	Approximately 3 years 3 months prior to study entry	Approximately 2 years 11 months prior to study entry
Radiotherapy	Adjuvant	Lymph nodes (cervico-supraclavicular, axillary and parasternal) and left chest wall (total dose: 46 cGy; 2 fractions)	Approximately 3 years prior to study entry	Approximately 2 years 10 months prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 2 years 9 months prior to study entry	−30

No medical history was reported. Other surgical history included oophorectomy and appendicectomy. Concurrent conditions included alanine aminotransferase increased, aspartate aminotransferase increased, chronic pancreatitis, chronic cholecystitis, gastric ulcer, diabetes mellitus, hypertension, coronary artery arteriosclerosis, chronic pyelonephritis, seroma, vaginal prolapse, upper abdominal pain, asthenia, and back pain.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included loperamide, ademetionine, metformin, bisoprolol, losartan and omeprazole.

The patient was noted with worsening of pre-existing condition of aspartate aminotransferase increased to Grade 2 (non-serious, related) from Study Day 117 to Study Day 131. No treatment was given for this event. Relevant laboratory parameters reported in the table below.

On Study Day 145, a laboratory work-up again showed worsening of pre-existing condition of aspartate aminotransferase increased (non-serious, related) to Grade 2. She received treatment with ademetionine and thioctic acid. She also received calcium chloride/potassium chloride/sodium chloride, potassium chloride and ascorbic acid for hepatopathy prophylaxis. Relevant laboratory parameters reported in the table below.

Event 1: Alanine aminotransferase increased
Event 2: Aspartate aminotransferase increased

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 153 and ipatasertib (300 mg) on Study Day 158.

On Study Day 159, the patient was noted with worsening of pre-existing condition of alanine aminotransferase increased and ongoing event of aspartate aminotransferase increased to Grade 3 (both non-serious) with ALT 288 U/L and AST 292 U/L. Treatment with thioctic acid was maintained and she received additional treatment with glycyrrhizic acid/phospholipids, calcium chloride/potassium chloride/sodium chloride, potassium chloride and prednisolone. On Study Day 167, she experienced Grade 2 asthenia and decreased appetite (both non-serious, unrelated). No treatment was administered for asthenia and decreased appetite. The events of alanine aminotransferase increased, aspartate aminotransferase increased, asthenia and decreased appetite remained unresolved at the time of patient′s death (see narrative below).

Relevant chemistry work-up:

Study Day	**AST** Normal range: 10-40 U/L	**ALT** Normal range: 10-40 U/L	**ALP** Normal range: 115-306 U/L	**Bilirubin** Normal range: 5.5-20.5 μmol/L
Screening	85	116	311	9.5
103	76	123	331	25
117	145	146	453	6.9
131	77	129	427	10.5
145	199	197	495	9.1
159	292	288	531	13.6
173	382	598	1260	104

Due to the events of alanine aminotransferase increased and aspartate aminotransferase increased, study treatment with ipatasertib was interrupted from Study Day 160 and Cycle 6 Day 15 dose of paclitaxel was not administered.

The Investigator considered alanine aminotransferase increased and aspartate aminotransferase increased, to be related to ipatasertib and paclitaxel.

On Study Day 173, a radiographic response assessment showed disease progression with new lesions in brain (cerebellum) and liver.

On Study Day 174, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 153 and Study Day 159, respectively. The patient entered into long-term follow-up.

On Study Day182, the patient died due to disease progression. It was unknown whether an autopsy was performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/305626	Patient number	2043
Demographics:	48-year-old female (race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was diagnosed with poorly differentiated, ER negative/PR positive and HER2 negative metastatic right breast cancer (T4N3M1; histological subtype: not otherwise specified) on Study Day −36.

At screening, sites of disease involvement included right breast (external quadrant), lymph nodes (right axillary adenopathy, retro pectoral adenopathy and group IV right neck adenopathy), neck (adenopathy in left group IV of the neck) and chest (left axillary adenopathy).

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent condition included neck pain.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

On Study Day 121, a radiographic response assessment showed disease progression with new lesions in brain (two nodular enhancement zones of 0.9 cm and 0.4 cm located in the left frontal parasagittal region).

On Study Day 125, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 113 and Study Day 118, respectively. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to brain (holocranial fields; 3000 cGy, 10 fractions)	129	141

On Study Day 146, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304754	Patient number	2073
Demographics:	66-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER positive, PR negative and HER2 negative right breast cancer (TxNxMx), approximately 23 years prior to study entry.

The patient was diagnosed with locally recurrent disease, metastatic disease and locally advanced unresectable disease, approximately 3 years prior to study entry, with ER/PR positive and HER2 negative disease in recurrent/metastatic tissue. At screening sites of disease involvement included liver (porta), bone (calotte and bilateral femur), right lateral chest wall and pleura. The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy	Approximately 23 years prior to study entry	NA
Cancer therapy	Metastatic	Anastrozole and Denosumab	Approximately 3 years prior to study entry	Approximately 2 years prior to study entry
Cancer therapy	Metastatic	Fulvestrant and palbociclib	Approximately 2 years prior to study entry	Approximately 8 months prior to study entry
Radiotherapy	Metastatic	Right femur (total dose: 38 cGy; 15 fractions)	−17	−6

No medical or other surgical history was reported. The patient′s concurrent conditions included hypothyroidism, hypertension, bone pain and decreased appetite.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included dexamethasone, levothyroxine and metamizole.

On Study Day 125, a radiographic response assessment showed disease progression with new lesions in lymph nodes (mediastinal and para-aortal) and pleural carcinosis (pleural effusion).

On Study Day 126, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 100 and Study Day 105, respectively. The patient entered into the long-term follow-up.

On Study Day 131, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Demographics:	39-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		
Additional category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR positive and HER2 negative left breast cancer (T2N0M0; histological grade unknown) on Study Day −966.

On Study Day −54, the patient was diagnosed with metastatic disease (no results were available for hormone and HER2 receptor status in recurrent/metastatic tissue). At screening sites of disease involvement included lung (bilateral lung cancerous lymphangiopathy), liver (bilateral lobe; multiple), bone, lymph nodes (left axillary) and pericardial cavity (bilateral pleural

effusion). The patient was assessed by the Investigator to have endocrine resistance and visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left partial mastectomy	−890	NA
Radiotherapy	Adjuvant	Left breast (total dose: 6000 cGy; 30 fractions)	−834	−793
Cancer therapy	Adjuvant	Tamoxifen	−793	−63

No medical or other surgical history was reported. The patient′s concurrent conditions included hyperlipidemia, hypothyroidism, depression, seasonal allergy, and cough.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included duloxetine, aripiprazole, levothyroxine, and atorvastatin.

On Study Day 1, the patient started receiving loperamide prophylactically (total daily dose: 4 mg). On Study Day 3, loperamide dose was reduced to 3 mg, which was further reduced to 1 mg (total daily dose) on Study Day 4.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 4.

On Study Day 5, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. Loperamide dose was increased to 2 mg (total daily dose). On the following day (Study Day 6), diarrhea improved to Grade 1. On Study Day 11, loperamide dose was increased to 3 mg (total daily dose). On Study Day 13, diarrhea worsened to Grade 3. On Study Day 15, loperamide dose was further increased to 6 mg (total daily dose). On Study Day 16, the event of diarrhea was considered resolved and the patient continued on loperamide prophylactically (total daily dose: 4 mg).

Loperamide details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	4	PO	1	2
Diarrhea prophylaxis	3	PO	3	3
Diarrhea prophylaxis	1	PO	4	4
Diarrhea	2	PO	5	10

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	3	PO	11	12
Diarrhea	4	PO	13	14
Diarrhea	6	PO	15	15
Diarrhea prophylaxis	4	PO	16	24

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, ipatasertib was initially interrupted on Study Day 15 and then resumed at a reduced dose of 300 mg on Study Day 22.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

After resolution of Grade 3 diarrhea, the patient experienced multiple non-serious events of diarrhea detailed in the table below. There was no change in study treatment due to these events. Treatment included loperamide (details reported in table below), probiotics (from Study Day 29 to Study Day 127) and Tsumura Hangeshashinto extract (from Study Day 43 to Study Day 168).

Most extreme Grade	Onset day	Resolution day/Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
2	25	29	Related	Unrelated
1	39	52	Related	Unrelated
2	80	102	Related	Related

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	25	25
Diarrhea	6	PO	26	28
Diarrhea prophylaxis	6	PO	29	37
Diarrhea prophylaxis	4	PO	38	38

Diarrhea prophylaxis	4	PO	96	96
Diarrhea prophylaxis	6	PO	97	100
Diarrhea	6	PO	101	101
Diarrhea prophylaxis	6	PO	102	115

Event 2: Diarrhea

Prior to the event of diarrhea (second episode), the most recent dose of paclitaxel was administered on Study Day 129 and ipatasertib (300 mg) on Study Day 130. The patient received loperamide 4 mg (total daily dose) prophylactically on Study Day 130.

On Study Day 131, the patient experienced non-serious Grade 3 diarrhea. Loperamide dose was increased to 6 mg (total daily dose). She also received probiotics and Tsumura Hangeshashinto extract. On the following day (Study Day 132), loperamide dose was increased to 12 mg (total daily dose) and diarrhea improved to Grade 2. On Study Day 134, loperamide dose was reduced to 10 mg (total daily dose) and on Study Day 136, further reduced to 8 mg (total daily dose). On Study Day 137, the event of diarrhea was considered resolved and the patient was started on loperamide prophylactically (total daily dose: 6 mg).

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	4	PO	116	128
Diarrhea prophylaxis	2	PO	129	129
Diarrhea prophylaxis	4	PO	130	130
Diarrhea	6	PO	131	131
Diarrhea	12	PO	132	133
Diarrhea	10	PO	134	135

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	4	PO	210	218
Diarrhea prophylaxis	2	PO	219	219
Diarrhea prophylaxis	4	PO	220	229
Diarrhea prophylaxis	2	PO	230	230
Diarrhea prophylaxis	4	PO	231	232
Diarrhea prophylaxis	2	PO	233	237
Diarrhea prophylaxis	4	PO	238	238
Diarrhea prophylaxis	2	PO	239	241
Diarrhea	4	PO	242	242
Diarrhea prophylaxis	2	PO	243	257

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 132 and resumed on Study Day 141.

The Investigator considered diarrhea to be related to ipatasertib and paclitaxel.

After resolution of second episode of Grade 3 diarrhea, the patient experienced multiple non-serious events of diarrhea detailed in the table below. There was no change in study treatment due to these events. Treatment included loperamide (details reported in table above) and probiotics (from Study Day 169 to Study Day 260).

Most extreme Grade	Onset day	Resolution day/Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
1	155	166	Related	Related
1	182	185	Related	Related
1	208	209	Related	Related
1	242	243	Related	Related

On Study Day 252, a radiographic response assessment showed disease progression.

On Study Day 258, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 232 and Study Day 236, respectively. The patient entered into long-term follow-up.

On Study Day 263, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305427	Patient number	2108
Demographics:	55-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		

Cohort:	Cohort B
Category:	Death due to disease progression

The patient was randomized on Study Day -1.

The patient was initially diagnosed with lobular, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T3N1M0), approximately 4 years 2 months prior to study entry.

On Study Day -273, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included liver (segment IV and VIII) and bone (axial skeletal). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Paclitaxel	Approximately 3 years 11 months prior to study entry	Approximately 3 years 9 months prior to study entry
Cancer therapy	Neo-adjuvant	Fluorouracil, epirubicin and cyclophosphamide	Approximately 3 years 8 months prior to study entry	Approximately 3 years 6 months prior to study entry
Surgery	Curative	Right radical mastectomy and right axillary lymph node dissection	Approximately 3 years 5 months prior to study entry	NA
Cancer therapy	Adjuvant	Tamoxifen	Approximately 3 years 2 months prior to study entry	–973
Radiotherapy	Adjuvant	Breast (side and dose unknown)	Approximately 3 years 3 months prior to study entry	Approximately 3 years 3 months prior to study entry
Cancer therapy	Adjuvant	Letrozole	–973	–273
Radiotherapy	Adjuvant	Bone (D7) (total dose: 40 cGy; single fraction)	–193	–193

No medical or other surgical history was reported. The patient′s concurrent condition included back pain.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included zoledronic acid.

On Study Day 26, the patient showed symptomatic deterioration (worsening asthenia, nausea, chronic headache and vomiting). On the same day (Study Day 26), a radiographic response assessment showed disease progression with new lesions in the brain. Subsequently, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 15 and Study Day 21, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatment	Start Day	Stop Day
Radiotherapy to bone (Holocranial; total dose: 30 cGy)	33	43

On Study Day 46, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/304195	Patient number	2180
Demographics:	57-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		
Additional category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T2N1M0), approximately 4 years prior to study entry followed by right radical mastectomy.

On Study Day −29, the patient was diagnosed with metastatic disease (ER/PR unknown and HER2 receptor not assessed in metastatic tissue). At screening, sites of disease involvement included liver (segment 2 and 6), bone (vertebrae TH12, L1, L2) and liver (bilateral lobes). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Supraclavicular and parasternal lymph node (dose: 40 cGy, 20 fractions)	Approximately 4 years prior to study entry.	Approximately 4 years prior to study entry.
Cancer therapy	Adjuvant	Cyclophosphamide, methotrexate and fluorouracil	Approximately 4 years prior to study entry.	Approximately 3 years prior to study entry

No medical or surgical history was reported. Concurrent conditions included goiter, renal hamartoma, osteoarthritis (right hip) and spinal pain (lumbar spine).

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included dexamethasone and ketorolac.

Event: Neuropathy peripheral (Neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 253.

On Study Day 253, the patient was diagnosed with non-serious Grade 3 (initial intensity Grade 1) neuropathy peripheral (presenting signs and symptoms not reported). No treatment was given for this event.

Due to this event, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose given on Study Day 267.

On Study Day 281, the event of neuropathy peripheral worsened to Grade 3 and on Study Day 349, improved to Grade 1, which remained unresolved at the time of patient′s death (see narrative below).

The Investigator considered neuropathy peripheral, to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 349, the patient showed symptomatic deterioration (fatigue and weakness).

On the same day (Study Day 349), study treatment with ipatasertib was permanently discontinued due to symptomatic deterioration with the last dose administered on Study Day 329. The patient entered into the long-term follow-up.

On Study Day 350, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Alopecia	2	Non-serious	27	Unresolved	Unrelated	Related

Study Number/CRTN:	CO40016/306642	Patient number	2192

Demographics:	53-year-old White female
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort:	Cohort B
Event (PT) Categories:	Febrile neutropenia SAE, AE leading to study treatment discontinuation
Additional category:	Death due to disease progression

The patient was randomized on Study Day –2.

The patient was initially diagnosed with lobular, moderately differentiated ER/PR positive and HER2 negative left breast cancer (T3N1M1) on Study Day –43 following left breast biopsy.

At screening sites of disease involvement included liver (segment V, VI and VII), bone and left axillary lymph node. The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Metastatic	Bone (lumbar region; total dose: 3000 cGy; 10 fractions)	-34	-16

The patient′s medical history included depression and non-cardiac chest pain. No other surgical history was reported. Concurrent condition included nausea.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included denosumab, fentanyl, metoclopramide, calcium carbonate, alprazolam, fluoxetine, and paracetamol.

Event: Febrile neutropenia

Prior to the event of febrile neutropenia, the most recent dose of paclitaxel was administered on Study Day 148 and ipatasertib (400 mg) on Study Day 149.

On Study Day 151, the patient experienced fever (body temperature not provided) and was noted with Grade 2 stomatitis (non-serious, unrelated). A laboratory work-up revealed Grade 3

febrile neutropenia (neutrophil count 0.78 $\times$ $10^3/\mu L$; normal range: 1.6-7.5 $\times$ $10^3/\mu L$). Reportedly, fever lasted for 30 minutes on Study Day 151. She received treatment with filgrastim. The following day (Study Day 152), she experienced Grade 1 diarrhea (non-serious, related) and her body temperature was 38.2°C. Reportedly, the patient refused hospitalization on Study Day 152 and started outpatient treatment with amoxicillin and ciprofloxacin for possible neutropenic sepsis. However, on Study Day 153, she was feeling unwell. Vitals showed tachycardia (heart rate 125 beats/minute), hypotension (blood pressure 80/60 mmHg) and fever (body temperature 37.2°C). Blood gas analysis showed oxygen saturation 94.6%, pH 7.45, pCO_2 33.1 and pO_2 48.7. Subsequently, she was hospitalized with neutropenic sepsis and for further investigations and treatment. Laboratory work-up also showed Grade 3 thrombocytopenia (ongoing since Study Day 112; non-serious, related), Grade 3 anemia (ongoing since Study Day 29; non-serious, related), increased lactate (34 mg/dL; normal range not reported) and increased C-reactive protein (CRP: 12.72 mg/dL, normal value $\leq$ 0.3 mg/dL). Blood and urine cultures were negative. It was reported that during her admission, she remained hemodynamically stable. She also received treatment with filgrastim, meropenem, fluconazole, benzydamine, miconazole, acyclovir, 2 units of red blood cells and intravenous fluids and showed rapid clinical improvement.

On Study Day 155, she was noted with Grade 2 sinus tachycardia (non-serious, unrelated; heart rate: 125 beats/minute) for which she received treatment with metoprolol and bisoprolol. The same day (Study Day 155), diarrhea was considered resolved. On Study Day 156, she experienced Grade 2 cough (non-serious, unrelated) for which she was given budesonide. Her chest X-ray revealed blunting of the costophrenic angle. Due to persistent fever and productive cough, a CT scan was performed which showed evidence of pneumonia. She received treatment with amikacin. Sputum cultures were positive for hemolytic *Streptococcus*. On Study Day 159, she was also diagnosed with Grade 2 lower respiratory tract infection (non-serious, unrelated). She received treatment with furosemide and fresh frozen plasma with significant improvement for edema peripheral, vancomycin, cefixime and levofloxacin for lower respiratory tract infection and ivabradine for sinus tachycardia. On the same day (Study Day 159), the event of febrile neutropenia was considered as resolved. On Study Day 161, stomatitis and cough resolved and the patient was discharged from the hospital. On Study Day 167, the event of lower respiratory tract infection resolved. The events of anemia, thrombocytopenia and sinus tachycardia remained unresolved at the time of patient's death (see narrative below).

Due to the event of febrile neutropenia, study treatment with ipatasertib was interrupted on Study Day 152 and resumed on Study Day 169 at a reduced dose of 300 mg; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 148.

The Investigator considered febrile neutropenia to be related to ipatasertib and paclitaxel.

On Study Day 195, the patient was noted to have symptomatic deterioration [fatigue, ascites (pleural effusion), elevated liver enzymes, jaundice, hemolysis and lethargy].

On Study Day 198, study treatment with ipatasertib was permanently discontinued due to symptomatic deterioration with the last dose administered on Study Day 189. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Letrozole	198	202

On Study Day 203, the patient died due to disease progression. An autopsy was not performed.

1.3 NARRATIVES FOR PATIENTS WHO EXPERIENCED SERIOUS ADVERSE EVENT(S)

Study Number/CRTN:	CO40016/307263	Patient number	2001
Demographics:	63-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Abdominal abscess SAE		
Event 2 (PT) Category:	Pneumonia SAE		

The patient was randomized on Study Day −2.

The patient was diagnosed with ductal, poorly differentiated, ER/PR positive and HER2 negative, locally advanced unresectable metastatic left breast cancer (T4cN3cM1) on Study Day −47.

At screening, sites of disease involvement included left breast, bilateral lung, bone (multiple lesions) and left sub-clavicular and right axillary lymph nodes. The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatments were reported.

The patient′s medical history included facial paralysis. No surgical history was reported. Concurrent conditions included hypertension, cancer pain and skin ulcer.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amlodipine/irbesartan, teprenone, metronidazole, loxoprofen and cefmetazole.

Event 1: Abdominal abscess

Prior to the event of abdominal abscess, the most recent dose of paclitaxel was administered on Study Day 45 and ipatasertib (400 mg) on Study Day 51.

On Study Day 59, the patient experienced right lower abdominal pain. A laboratory work-up showed elevated C-reactive protein at 10.19 mg/dL (normal range not provided). An abdominal CT-scan showed Grade 3 appendicitis (non-serious, unrelated) and Grade 3 abdominal abscess, leading to hospitalization. Necrotizing appendicitis rupture was also suspected. On Study Day 74, laparoscopic ileocolic resection was performed. She further received treatment with calcium chloride dihydrate/glucose/potassium chloride/sodium acetate, cyanocobalamin/pyridoxine/thiamine disulfide, amino acids/electrolytes/glucose/thiamine, carbohydrates/potassium chloride/sodium chloride/sodium lactate, magnesium citrate, sennoside A+B calcium, calcium chloride dihydrate/potassium chloride/sodium acetate trihydrate/ sodium chloride, carbazochrome sodium sulfonate, tranexamic acid, glycerol, remifentanil, rocuronium, propofol, flurbiprofen, ephedrine, phenylephrine, sugammadex, dexamethasone, calcium gluconate monohydrate/glucose/magnesium chloride hexahydrate/potassium chloride/sodium acetate/sodium chloride/sodium citrate dihydrate, glucose/magnesium chloride hexahydrate/potassium chloride/potassium phosphate monobasic/sodium acetate trihydrate/sodium chloride, ascorbic acid and fentanyl citrate. On Study Day 80, it was reported that the patient had a good postoperative care. On the same day (Study Day 80), her symptoms recovered; the events of abdominal abscess and appendicitis improved to Grade 1 and she was discharged from the hospital. On Study Day 94, the events of abdominal abscess and appendicitis were considered resolved.

Due to the event of abdominal abscess, study treatment with ipatasertib was interrupted on Study Day 59 and paclitaxel was interrupted at Cycle 3. The next dose of ipatasertib and paclitaxel was administered on Study Day 87.

The Investigator considered abdominal abscess to be unrelated to ipatasertib and paclitaxel and related to other cause (appendicitis).

Event 2: Pneumonia

Prior to the event of pneumonia, the most recent dose of paclitaxel was administered on Study Day 269 and ipatasertib (400 mg) on Study Day 275.

On Study Day 278, during tumor assessment week 40 visit, the patient presented with cough. A CT-scan showed opaque area over the lower right lung field and the patient was diagnosed with Grade 2 pneumonia (initial intensity Grade 1). On the same day (Study Day 278), she was also reported with disease progression with new lesions in right lung (confirmed after subsequent scan on Study Day 334). She was started on treatment with levofloxacin and L-carbocisteine for pneumonia. On Study Day 311, a repeat CT-scan showed deterioration of right lung field opaque area. On Study Day 317, she was hospitalized for bronchoscopy to differentiate breast cancer metastasis, inflammation and lung cancer. She received treatment with midazolam, flumazenil, and lidocaine. Bronchoscopy was performed, and biopsy showed metastatic breast cancer. On Study Day 318, the patient was discharged from the hospital. On Study Day 334, CT-scan showed reduced invasion opaque area. On the same day (Study Day 334), a

radiographic response assessment confirmed new lesion in right lung. On Study Day 338, the event of pneumonia was considered resolved.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4-9 $\times$ 10^9/L	**Neutrophils** Normal range: 38-58%	**Lymphocytes** Normal range: 26-47%
Screening	78.1	69.6	24.7
283	58.5	65.5	26.8
311	78.6	76	17.3

There was no change in study treatment due to the event of pneumonia.

The Investigator considered pneumonia to be unrelated to ipatasertib and paclitaxel and related to other cause (unspecified).

On Study Day 339, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 325 and ipatasertib on Study Day 331. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Fulvestrant	348	348
Fulvestrant and Abemaciclib	369	485
Fulvestrant	493	689
Eribulin	695	997
Capecitabine	1004	1249
Paclitaxel and Bevacizumab	1262	Ongoing

On Study Day 1395, the patient was discontinued from the study as per physician decision (study was terminated by the Sponsor).

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**

Event 1 (PT) Categories:	Diarrhea SAE, AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Categories:	Hyperglycemia SAE, AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hyperglycemia		
Event 3 (PT) Category:	Dehydration SAE		
Event 4 (PT) Category:	Hypoglycemia SAE		
Event 5 (PT) Categories:	Respiratory distress Death due to AE, SAE		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/305631	Patient number	2029
Demographics:	50-year-old female (race unknown)		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Categories:	Pneumonitis SAE, AE leading to study treatment discontinuation, AESI: Grade ≥ 2 Pneumonitis		

The patient was randomized on Study Day 1.

The patient was diagnosed with ER/PR positive and HER2 negative left breast cancer (T3N3M1; histological grade unknown and subtype: not otherwise specified) on Study Day −34.

At screening sites of disease involvement included breast (left external quadrant), left axillary lymph nodes and bone (right scapula, right fourth coastal posterior arch, right ninth costal posterior arch and midline vertebra lumbar 3).

No past cancer treatments were reported.

The patient′s medical history included arachnoid cyst. Surgical history included ventriculoperitoneal shunt placement and cholecystectomy. Concurrent conditions included hypertension and insomnia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included pregabalin, cyclobenzaprine, tramadol, and losartan.

Event: Pneumonitis

Prior to the event of pneumonitis, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 28, the patient experienced dyspnea. A laboratory work-up showed Grade 3 lymphopenia (lymphocyte count $0.58 \times 10^3/\mu L$, normal range: 1-$4.8 \times 10^3/\mu L$) and Grade 2 anemia (hemoglobin 9.9 g/dL, normal range not provided). Chest X-ray showed interstitial basal infiltrate with right para cardiac basal predominance and obturation of costophrenic angles. She was diagnosed with Grade 2 pneumonitis.

On Study Day 29, during scheduled Cycle 2 visit, the patient′s oxygen saturation was 78% and she had fever (body temperature 39.2°C). She also experienced pain in lower limbs. Her ECOG Performance status was 2. CT scan showed multiple bilateral parenchymal opacities distributed diffusely (predominantly in upper lobes); suggestive of inflammatory parenchymal process. Subsequently, she was hospitalized for worsening of pneumonitis to Grade 3. The same day (Study Day 29), blood and urine cultures were negative. During hospitalization, she received oxygen support by nasal cannula and received treatment with meropenem, trimethoprim/sulfamethoxazole, oseltamivir, hydrocortisone, furosemide, enoxaparin, midazolam and levofloxacin. She also received dietary and hydration advice. On Study Day 34, the event of pneumonitis improved to Grade 2. On Study Day 37, her ECOG Performance status improved to Grade 1. On the same day (Study Day 37), the event of pneumonitis was considered resolved and she was discharged from the hospital.

On Study Day 45, study treatment was permanently discontinued as per the physician decision due to the event of pneumonitis with the last dose of paclitaxel administered on Study Day 15 and ipatasertib on Study Day 21. The patient entered into long-term follow-up.

The Investigator considered pneumonitis to be related to ipatasertib and unrelated to paclitaxel.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel	51	Ongoing

On Study Day 206, the patient withdrew consent from the study.

No other AEs were experienced by the patient during the study.

Study Number/CRTN:	CO40016/305386	Patient number	2032
Demographics:	51-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Hyperglycemia AESI: Grade $\geq$ 3 hyperglycemia		
Event 2 (PT) Categories:	Hyperglycemia AE leading to study treatment discontinuation, AESI: Grade $\geq$ 3 hyperglycemia		
Event 3 (PT) Category:	Deep vein thrombosis SAE		
Event 4 (PT) Category:	Extravasation SAE		

The patient was randomized on Study Day −1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative metastatic right breast cancer (T2NXM1) Study Day −102, following right palliative lumpectomy. At screening sites of disease involvement included lung (right upper lobe and bilateral nodes), bone (axial skeleton) and pericardial effusion. The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatments were reported.

No medical history was reported. The patient′s other surgical history included cholecystectomy, caesarean section and intrauterine device (copper T) installation. Concurrent conditions included hypertension and type II diabetes mellitus.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included enalapril, propranolol, hydrochlorothiazide, metformin, ethinyl estradiol/gestodene and pamidronate.

Event 1: Hyperglycemia (Asymptomatic hyperglycemia)

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 43 and ipatasertib (400 mg) on Study Day 48.

On Study Day 57, the patient presented for scheduled Cycle 3 Day 1 visit. Her laboratory work-up showed non-serious Grade 3 hyperglycemia (glucose 272 mg/dL; normal range: 70-100 mg/dL). No new treatment was reported for the event; however, treatment with metformin (ongoing medication from prior to study start) and glibenclamide (started on Study Day 7) was maintained for her pre-existing condition of diabetes mellitus (for treatment details please refer to table below). Relevant laboratory work-up has been reported in the table below. On Study Day 62, the event of hyperglycemia improved to Grade 2. On Study Day 70, the event of hyperglycemia was considered resolved.

Due to the event of hyperglycemia, there was no change in treatment with paclitaxel; however, treatment with ipatasertib was interrupted on Study Day 57 and was resumed at a reduced dose of 300 mg on Study Day 70.

The Investigator considered hyperglycemia to be unrelated to paclitaxel and related to ipatasertib and concurrent illness.

Event 2: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of paclitaxel was administered on Study Day 70 and ipatasertib (300 mg) on Study Day 76.

On Study Day 85, the patient presented for scheduled Cycle 4 Day 1 visit and was reported with non-serious Grade 3 hyperglycemia (no supporting glucose value corresponding to Grade 3 was available). Reportedly, she maintained poor metabolic control due to incorrect eating habits. No additional treatment was reported other than concomitant metformin and glibenclamide (for treatment details please refer to table below), however ipatasertib was not administered, and home glucose monitoring started.

Hyperglycemia treatment details:

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Metformin	Diabetes mellitus	850	PO	BID	Approximately 3 years prior to study entry	43
Glibenclamide	Diabetes mellitus	5	PO	TID	7	Ongoing
Metformin	Diabetes mellitus	850	PO	TID	43	Ongoing

On Study Day 155, the event of hyperglycemia improved to Grade 1. On Study Day 168, the event of Grade 3 hyperglycemia was considered resolved; however, the patient then had a subsequent event of Grade 2 hyperglycemia (non-serious, unrelated) from Study Day 169; ipatasertib remain interrupted. Although glucose levels remained at Grade 2 and levels did not resolve between these events, site considered these separate events, with differing causality noted. Per site feedback: the patient did not have proper diet even when educated about it. The event of hyperglycemia improved and worsened multiple times (reported in table below with most extreme intensity as Grade 3 on Study Day 508); however, remained unresolved at the time of study discontinuation.

Hyperglycemia grade changes:

606	193	—

Due to the event of hyperglycemia, there was no change in study treatment with paclitaxel; however, ipatasertib was permanently discontinued with the last dose administered on Study Day 76.

The Investigator considered hyperglycemia to be unrelated to paclitaxel and related to ipatasertib and concurrent illness.

On Study Day 316, during Cycle 12 Day 8 paclitaxel administration, the patient developed Grade 1 extravasation on left arm (non-serious, related to paclitaxel), which was considered to be a local infusion site reaction. The event was also considered to be related to procedure. On Study Day 324, extravasation worsened to Grade 3. She underwent central catheter placement and also received treatment with fluticasone. On Study Day 344, the event of extravasation improved to Grade 1. She further received treatment with pregabalin and serrapeptase.

Event 3: Deep vein thrombosis (Deep vein thrombosis right leg)

Prior to the event of deep vein thrombosis, the most recent dose of paclitaxel was administered on Study Day 435; ipatasertib had already been discontinued.

On Study Day 438, the patient experienced edema and change in color of skin on right leg. She was hospitalized with the suspicion of thrombosis. On Study Day 440, an ECHO doppler was performed and the patient was diagnosed with Grade 3 deep vein thrombosis. On Study Day 442, the patient was discharged from the hospital. On Study Day 448, she was started on treatment with enoxaparin which remained ongoing. Platelet count remained normal throughout the course of the event. On Study Day 516, event of deep vein thrombosis improved to Grade 1. On Study Day 622 (partial day), the event of deep vein thrombosis was considered resolved.

There was no change in study treatment with paclitaxel due to the event of deep vein thrombosis.

The Investigator considered deep vein thrombosis to be unrelated to paclitaxel and ipatasertib and related to disease under study.

Event 4: Extravasation (Left arm extravasation)

Prior to the event of extravasation, the most recent dose of paclitaxel was administered on Study Day 463; ipatasertib had already been discontinued.

On Study Day 476, the patient felt pain and sensation on her left arm, making it difficult for her to perform self-care activities of daily living. The ongoing event of extravasation was assessed as serious Grade 3 and was considered to cause significant disability. She was started on physiotherapy (twice per week) and was asked to put on compression sleeve. Therapy kinesics focused on manual lymphatic lymph drainage and education. The patient evolved favorably to the treatment, and her pain decreased. On Study Day 516, the event of extravasation improved to Grade 2; however, remained unresolved at the time of study discontinuation.

There was no change in study treatment with paclitaxel due to the event of extravasation.

The Investigator considered extravasation to be unrelated to ipatasertib and related to paclitaxel and other unspecified procedure.

On Study Day 658, study treatment with paclitaxel was permanently discontinued as per the physician’s decision (patient stop attending visits, assessment CT scan, bone scan) with study treatment with the last dose administered on Study Day 621. The patient entered into the long term follow-up.

On the same day (Study Day 658), the patient withdrew the consent from the study.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	2	Non-serious	12	60	Related	Unrelated
Incorrect dose administered	1	Non-serious	22	25	Related	Unrelated

Study Number/CRTN:	CO40016/310803	Patient number	2033
Demographics:	76-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Categories:	Death Death due to AE, SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/304879	Patient number	2037
Demographics:	42-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Hypersensitivity SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR positive, right breast cancer (T2N1MX; histological grade unknown, HER 2-status not assessed), approximately 7 years prior to study entry.

On Study Day −377, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included left breast, skin (bilateral breast and chest wall) and lymph node (left breast axillary nodes). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin, cyclophosphamide, and docetaxel	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Neo-adjuvant	Goserelin	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 7 years prior to study entry	Approximately 1 year 4 months prior to study entry
Surgery	Curative	Right simple mastectomy	Approximately 7 years prior to study entry	NA
Cancer therapy	Metastatic	Letrozole and goserelin	−350	−20

No medical or other surgical history was reported. Concurrent condition included back pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), she was started on famotidine, chlorphenamine and dexamethasone as prophylaxis for hypersensitivity.

No concomitant medications ongoing at Study Day 1 were reported.

On Study Day 9, the patient experienced Grade 2 rash (non-serious, related to ipatasertib and unrelated to paclitaxel). She received treatment with bepotastine besilate, chlorpheniramine, hydrocortisone, and methylprednisolone. On Study Day 16, the patient received azelastine as prophylaxis for itching. On the same day (Study Day 16), rash resolved.

Event: Hypersensitivity (Hypersensitivity reaction)

On Study Day 17, the patient received ipatasertib (400 mg) as scheduled. On the same day, prior to scheduled Cycle 1 Day 15 dose of paclitaxel, vital signs showed body temperature 36.7°C, pulse rate 69 beats/min, respiratory rate 18 breaths/min and blood pressure 109/58 mmHg. Prophylactic medications included montelukast sodium and hydrocortisone sodium succinate for hypersensitivity and ondansetron for nausea.

At 14:49 hours, the patient started receiving paclitaxel infusion. During the paclitaxel infusion, she experienced Grade 1 myalgia (non-serious, related to paclitaxel), Grade 2 pruritus (non-serious, related to paclitaxel) and Grade 2 rash (non-serious, related). She was diagnosed with Grade 2 hypersensitivity (local infusion site reaction). Subsequently, paclitaxel infusion was interrupted. She received treatment with intravenous chlorphenamine, which resulted in improvement of symptoms. Treatment with bepotastine besilate, hydrocortisone and methylprednisolone was also maintained for rash. At an unspecified time, paclitaxel infusion was restarted slowly (rate not provided); however, it was interrupted again at 16:30 hours due to recurrence of rash and pruritus. Subsequently, the patient was hospitalized for close monitoring and paclitaxel desensitization. On the same day (Study Day 17), the event of myalgia was considered resolved without any treatment. On Study Day 18, she received fexofenadine and ketotifen fumarate for paclitaxel hypersensitivity and she completed remaining dose of paclitaxel. On Study Day 19, the event of rash improved to Grade 1. The same day (Study Day 19), the event of hypersensitivity was considered resolved, and the patient was discharged from the hospital. On Study Day 31, the event of pruritus was considered resolved. On Study Day 38, the patient received prophylactic intravenous dexamethasone for hypersensitivity reaction and the event of rash was considered resolved.

Due to the event of hypersensitivity, study treatment with ipatasertib was interrupted on Study Day 18 and the next dose of ipatasertib- was given on Study Day 21.

The Investigator considered hypersensitivity to be unrelated ipatasertib and related to paclitaxel and other causes (unspecified).

On Study Day 333, a radiographic response assessment showed disease progression.

On Study Day 344, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 325 and ipatasertib on Study Day 331. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Vinorelbine	368	Ongoing

On Study Day 444, the patient died due to disease progression. An autopsy was performed (details not provided)

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304332	Patient number	2039
Demographics:	59-year-old White female		

Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort:	Cohort B
Event (PT) Category:	Pathological fracture SAE

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T4N1M0), approximately 5 years prior to study entry followed by left simple mastectomy.

On Study Day −559, the patient was diagnosed with metastatic disease (ER/PR status was unknown and HER2 status not assessed in metastatic tissue). At screening sites of disease involvement included lung (bilateral including left S3 and S6), lymph nodes (aortic arch, right root, upper clavicular, bronchopulmonary, mediastinal and sternal), liver (segment VIII), chest (soft tissue), bilateral adrenal gland, bone and mediastinum. The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Tamoxifen	Approximately 5 years prior to study entry	−79
Radiotherapy	Adjuvant	Scar after left mastectomy (dose: 38 cGy), left axillary region (dose: 16 cGy), left upper clavicular and parasternal regions (each at 40 cGy)	Approximately 4 years 11 months prior to study entry	Approximately 4 years 11 months prior to study entry
Radiotherapy	Metastatic	Bone (hip joint at 38 cGy, pelvis at 18 cGy, right chest and vertebrae; each at 20 cGy)	−554	−320
Cancer therapy	Metastatic	Letrozole	−77	−24

No medical or other surgical history was reported. Concurrent conditions included cough, dyspnea, and pathological fracture (left femoral neck).

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event: Pathological fracture (Pathological fracture of the middle third bone of left femur)

Prior to the event of pathological fracture, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 23, the patient presented with pain in left leg. A CT was performed, and she was diagnosed with Grade 3 pathological fracture of the middle third bone of left femur with slight displacement of debris. The event of pathological fracture led to persistent or significant disability. The patient had no history of osteopenia or osteoporosis.

On Study Day 27, a repeat CT scan was performed, and she was also diagnosed with Grade 2 right femoral neck fracture (non-serious, unrelated). On Study Day 30, she was hospitalized and underwent intramedullary blocked osteosynthesis of the left femur. No treatment medications were reported for pathological and right femoral neck fractures. On Study Day 43, the event of pathological fracture was considered resolved and the patient was discharged from the hospital. The patient received zoledronic acid prophylactically for bone fractures. The event of femoral neck fracture remained unresolved at the time of patient's death.

Due to the event of pathological fracture, Cycle 2 Day 1 of paclitaxel was delayed and ipatasertib was interrupted on Study Day 29. The patient received the next dose of ipatasertib (400 mg) and paclitaxel on Study Day 50.

The Investigator considered pathological fracture to be unrelated to ipatasertib and paclitaxel and related to disease under study.

On Study Day 195, a radiographic response assessment showed disease progression with new lesions in liver (S7). Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 190 and ipatasertib on Study Day 196. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Epirubicin	213	280

On Study Day 373, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304335	Patient number	2072
Demographics:	53-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Paresthesia AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Blood creatine phosphokinase increased SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR positive and HER2 negative, left breast cancer (T1cN1M0; histological grade unknown), approximately 4 years 5 months prior to study entry following left partial mastectomy.

On Study Day −247, the patient was diagnosed with metastatic disease with ER positive/ PR negative and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included liver (segment II and III) and lymph node (left axilla, lumbo-aortic, subpectoral, site of the neck, celiac site, retrocaval site, retrocrural, and inter-aortic). The patient was assessed by the Investigator to have endocrine resistance and visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Docetaxel	Approximately 4 years 4 months prior to study entry	Approximately 3 year 11 months prior to study entry
Cancer therapy	Metastatic	Palbociclib and fulvestrant	−236	−41

No medical or surgical history and concurrent conditions were reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib.

No concomitant medications ongoing at Study Day 1 were reported.

Event 1: Diarrhea
Event 1: Paresthesia (Paresthesia lower limbs)
Event 2: Blood creatine phosphokinase increased (creatine kinase increased)

Prior to the event of diarrhea, the most recent dose of ipatasertib was administered on Study Day 1.

On Study Day 1, the patient experienced non-serious Grade 2 diarrhea. She received treatment with loperamide (details in the table below).

On Study Day 9 (Cycle 1 Day 1 dose was interrupted due to Grade 2 diarrhea), the patient received her first study treatment with paclitaxel.

Prior to the event of paresthesia, the most recent dose of paclitaxel was administered on Study Day 175 and ipatasertib (400 mg) on Study Day 181.

On Study Day 182, the patient experienced non-serious Grade 2 paresthesia in lower limbs (initial intensity Grade 1) along with Grade 1 asthenia and Grade 1 nail disorder (non-serious, related to paclitaxel). She received treatment with thioctic acid for paresthesia and tioconazole for nail disorder. On Study Day 189, the event of nail disorder worsened to Grade 2. She further received treatment with hydrogen peroxide and chlortetracycline for nail disorder.

Prior to the event of blood creatine phosphokinase increased, the most recent dose of paclitaxel was administered on Study Day 294 and ipatasertib (400 mg) on Study Day 307.

On Study Day 314, the patient was hospitalized with Grade 2 blood creatine phosphokinase increased (CPK 414 U/L). She was asymptomatic. Electrocardiogram (ECG) was performed (results not provided). No treatment was given for the event. On the same day (Study Day 314), the event of asthenia was considered resolved. No information regarding the patient′s discharge was provided. The events of diarrhea, paresthesia, nail disorder and blood creatine phosphokinase increased remained unresolved at the time of study discontinuation.

Due to the events of diarrhea and paresthesia, there was no change in treatment with ipatasertib; however due to the event of blood creatine phosphokinase increased, dose of ipatasertib was reduced to 300 mg on Study Day 349.

Due to the event of blood creatine phosphokinase increased, study treatment with paclitaxel was interrupted from Cycle 12 and later permanently discontinued due to the events of diarrhea and paresthesia with the last dose administered on Study Day 294.

The Investigator considered diarrhea to be unrelated to paclitaxel and related to ipatasertib.

The Investigator considered paresthesia to be related to paclitaxel and ipatasertib.

The Investigator considered blood creatine phosphokinase increased to be unrelated to paclitaxel and ipatasertib and related to other causes (unknown).

On Study Day 406, a radiographic response assessment showed disease progression.

On Study Day 412, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 397. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine and exemestane	448	Ongoing

On Study Day 1240, the patient was permanently discontinued from the study as per the physician’s decision (LTFU terminated by Sponsor)

Other AEs experienced by the patient during the study:

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T4dN2M0), approximately 3 years 3 months prior to study entry.

On Study Day −233, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included liver (segment VII and VIII). The patient was assessed by the Investigator to have endocrine resistance disease and visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy and right axillary lymph node dissection	Approximately 3 years prior to study entry	NA
Cancer therapy	Neo-adjuvant	Epirubicin, cyclophosphamide	Approximately 3 years 3 months prior to study entry	Approximately 3 years 1 month prior to study entry
Cancer therapy	Adjuvant	Paclitaxel	Approximately 2 years 10 months prior to study entry	Approximately 2 years 8 months prior to study entry
Cancer therapy	Adjuvant	Leuprorelin and letrozole	Approximately 2 years 7 months prior to study entry	Approximately 9 months prior to study entry
Radiotherapy	Adjuvant	Breast, chest and lymph nodes (dose unknown)	−961	−926

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Palbociclib, fulvestrant and leuprorelin	Approximately 8 months prior to study entry	Approximately 2 months prior to study entry

No medical or other surgical history was reported. Concurrent condition included back pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing on Study Day 1 was reported.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of ipatasertib (400 mg) and paclitaxel was administered on Study Day 8.

On Study Day 8, within 24 hours after end of paclitaxel infusion, the patient experienced non-serious Grade 1 (initial intensity) diarrhea (considered to be systemic infusion reaction). She received treatment with loperamide (total daily dose: 4 mg), metoclopramide and hydration. On Study Day 9, dose of loperamide was increased to 6 mg. On Study Day 10, diarrhea worsened to Grade 3 and loperamide dose was further increased to 8 mg and then to 12 mg on Study Day 11. On Study Day 63, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	8	8
Diarrhea	6	PO	9	9
Diarrhea	8	PO	10	10
Diarrhea	12	PO	11	14
Diarrhea	4	PO	15	16
Diarrhea	8	PO	17	17
Diarrhea	12	PO	18	18
Diarrhea	4	PO	19	24
Diarrhea	2	PO	25	25
Diarrhea	4	PO	31	31
Diarrhea	4	PO	34	34
Diarrhea	6	PO	36	36
Diarrhea	4	PO	37	37

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	6	PO	42	42
Diarrhea	8	PO	43	43
Diarrhea	4	PO	44	44
Diarrhea	4	PO	46	48
Diarrhea	6	PO	49	49

Due to the event of diarrhea, there was no change in treatment with paclitaxel; however, dose of ipatasertib was reduced to 300 mg on Study Day 29.

The Investigator considered diarrhea to be related to paclitaxel and ipatasertib.

Event 2: Abdominal pain

Prior to the event of abdominal pain, the most recent dose of paclitaxel was administered on Study Day 56 and ipatasertib (300 mg) on Study Day 62.

On Study Day 70, the patient experienced Grade 3 abdominal pain. On Study Day 74, she was hospitalized with worsening abdominal pain. It was reported that abdominal pain was suspected to be due to sub-occlusive state. Abdominal CT-scan was performed (results not provided). On Study Day 77, abdominal X-ray was performed (results not provided). She received treatment with ketorolac trometamol.

Due to the event of abdominal pain, study treatment with ipatasertib and paclitaxel was interrupted.

On Study Day 80, a radiographic response assessment showed disease progression with new lesions (bilateral pleural effusion, lung upper, lateral and lower; hepatic and pelvic).

On Study Day 87, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 56 and ipatasertib on Study Day 62. The patient entered into long-term follow-up.

On Study Day 100, the patient was discharged from the hospital. The event of abdominal pain remained unresolved at the patient′s death.

The Investigator considered abdominal pain to be unrelated to paclitaxel and ipatasertib and related to disease under study.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Vinorelbine and capecitabine	88	177

On Study Day 264, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Gamma-glutamyltransferase increased	2	Non-serious	8	Unresolved	Related	Related
Aspartate aminotransferase increased	1	Non-serious	8	Unresolved	Related	Related

Blood alkaline phosphatase increased	1	Non-serious	29	55	Related	Related
Leukopenia	2	Non-serious	43	Unresolved	Related	Related
Neutropenia	2	Non-serious	43	55	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304331	Patient number	2093
Demographics:	55-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Cholecystitis acute SAE		

The patient was randomized on Study Day -1.

The patient was initially diagnosed with right breast cancer (T2N1M0; histological grade unknown and subtype: not otherwise specified), approximately 2 years 9 months prior to study entry following right breast biopsy. Her ER/PR status was unknown and HER2 receptor status was not assessed.

On Study Day −38, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included lymph nodes (sub-cardiac, right axillary node with diameter 18 x 17 mm, left axillary node with diameter 15 x 15 mm and subaortic lymph node with diameter 14 x 13 mm), bilateral lungs (multiple lesions of 5, 10, 13 mm in size), bilateral pleural cavity (effusion in the pleural cavity with thickness 18 mm) and bone (lesions in thoracic and lumbar vertebra, pelvic bones, right side ribs, sternum and cranium). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Neo-adjuvant	Breast (right breast and lymph efflux route; 4000 cGy)	Approximately 2 years 9 months prior to study entry	−979
Surgery	Curative	Right mastectomy and right axillary lymph node dissection	−953	NA
Radiotherapy	Adjuvant	Other (unspecified; 2800 cGy)	−927	−909
Cancer therapy	Adjuvant	Doxorubicin, fluorouracil and cyclophosphamide	−878	−744

The patient′s medical history included chronic cholecystitis. Other surgical history included bilateral pleural cavity aspiration. Concurrent conditions included essential hypertension, myocardial fibrosis, left bundle branch block, mitral valve incompetence, tricuspid valve incompetence, cardiac failure, varicose vein, osteoarthritis (right knee and hip joint), obesity, hepatosplenomegaly, arterial disorder and renal cyst.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included losartan, ivabradine, spironolactone, torasemide and trimetazidine.

On Study Day 204, the patient was noted with Grade 1 hyperbilirubinemia (non-serious, related; bilirubin 25.8 μmol/L). She received treatment with ademetionine and *Cynara cardunculus* extract.

Event: Cholecystitis acute (Acute calculous cholecystitis)

Prior to the event of cholecystitis acute, the most recent dose of paclitaxel was administered on Study Day 204 and ipatasertib (400 mg) on Study Day 207.

On Study Day 208, the patient experienced acute pain in right hypochondrium and increased temperature (up to 37.8°C). She was transferred to the hospital. An abdominal ultrasound was performed, and she was diagnosed with Grade 3 acute calculous cholecystitis, leading to hospitalization. She received treatment with dexketoprofen trometamol, drotaverine, ceftriaxone, calcium chloride/potassium chloride/sodium chloride, diclofenac, metoclopramide, metamizole and enoxaparin. On Study Day 209, laparoscopic cholecystectomy was performed. She also received concomitant therapy with meldonium for cardiotoxicity prevention, calcium chloride/magnesium chloride/potassium chloride/sodium chloride/sodium lactate/sorbitol as detoxification therapy and dressings in surgery department. On Study Day 218, the event of cholecystitis acute was considered resolved. On Study Day 219, she was discharged from the hospital. On Study Day 225, the event of hyperbilirubinemia was considered resolved.

Relevant chemistry work-up:

Study Day	**AST** Normal range: 5-34 U/L	**ALT** Normal range: 4-36 U/L	**Bilirubin** Normal range: 3.4-20.4 μmol/L	**ALP** Normal range: 35-123 U/L
Screening	32	30	24.7	127
204	21	26	25.8	153
225	24	27	11.6	191

Due to the event of cholecystitis acute, study treatment with ipatasertib and paclitaxel was interrupted and later never resumed (details below).

The Investigator considered cholecystitis acute to be related to ipatasertib, paclitaxel and concurrent illness.

On Study Day 224, a radiographic response assessment showed disease progression with multiple new lesions in bilateral brain with left frontal lobe lesion measuring 15 x 13 mm in size.

On Study Day 269, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 204 and ipatasertib on Study Day 208. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Lomustine	239	473
Letrozole	239	504

On Study Day 564, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304195	Patient number	2107
Demographics:	70-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Categories:	Cerebrovascular accident SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER negative, PR positive and HER2 negative right breast cancer (T4N1M0; histological grade unknown), approximately 2 years and 10 months prior to study entry.

On Study Day −62, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER2 status not assessed in metastatic tissue. At screening, sites of disease involvement included bone, right lung root, peritoneum (mesentery and omentum), pleural effusion (left hemithorax), liver (segment V) and soft tissue (right chest). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Cyclophosphamide and Doxorubicin	Approximately 2 years and 10 months prior to study entry	−875
Surgery	Curative	Right radical mastectomy	−862	NA
Radiotherapy	Adjuvant	Parasternal and supraclavicular lymph nodes (40 cGy, 16 fractions)	−825	−801
Cancer therapy	Adjuvant	Tamoxifen	Approximately 2 years and 2 months prior to study entry	Approximately 2 months prior to study entry

No medical or other surgical history or concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included ranitidine, diphenhydramine, ondansetron and dexamethasone.

Event: Cerebrovascular accident

Prior to the event of cerebrovascular accident, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 15.

On Study Day 16, the patient experienced speech disorder. A CT scan showed ischemic cerebral circulation in the left temporal lobe and she was diagnosed with Grade 2 cerebrovascular accident (considered life-threatening and causing persistent or significant disability/incapacity). No treatment was reported for this event. The event of cerebrovascular accident remained unresolved at the time of study discontinuation.

Due to this event, study treatment was permanently discontinued with the last dose of paclitaxel given on Study Day 15 and ipatasertib on Study Day 17.

The Investigator considered cerebrovascular accident, to be unrelated to ipatasertib and paclitaxel and related to disease under study.

Other AE experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel
Diarrhea	1	Non-serious	8	19	Related	Related

Study Number/CRTN:	CO40016/304634	Patient number	2113
Demographics:	68-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Renal impairment SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER positive, PR negative and HER2 negative right breast cancer (T1cN0M0), approximately 7 years prior to study entry followed by lumpectomy and axillary lymph node dissection.

On Study Day −34, the patient was diagnosed with metastatic disease (ER/PR status unknown and HER2 status was not assessed in metastatic tissue). At screening, sites of disease involvement included bone (multiple lesions including soft tissue in the left hip bone), whole left and right lung, lymph node (midline aorto-pulmonary window, left gastric artery and right axillary) and infiltration in the left pleural cavity. The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Right breast and boost to the area of the tumor bed (dose: 4250 cGy, 17 fractions)	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 7 years prior to study entry	Approximately 1 year and 9 months prior to study entry

The patient′s medical history included cough and dyspnea exertional. No other surgical history was reported. Concurrent conditions included asthenia, hypothyroidism and type 2 diabetes mellitus.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included levothyroxine, metformin, and ranitidine.

On Study Day 279, the patient experienced Grade 2 decreased appetite (non-serious, unrelated). She was started on treatment with megestrol.

Event: Renal impairment (acute renal dysfunction)

Prior to the event of renal impairment, the most recent dose of paclitaxel was administered on Study Day 295 and ipatasertib (400 mg) on Study Day 297.

On Study Day 297, the patient was reported with exacerbation of pre-existing asthenia to Grade 3 (non-serious, related to paclitaxel), Grade 1 diarrhea (non-serious, related to ipatasertib), Grade 2 urinary tract infection (diagnostic details not reported) and Grade 1 right upper limb lymphedema (both non-serious, unrelated). On Study Day 298, she presented with ongoing events. A laboratory work-up showed sodium 125 mmol/L (normal range: 132-145 mmol/L), glucose 199 mg/dL (normal range: 70-99 mg/dL), creatinine 2.91 mg/dL (normal range: 0.6-1.1 mg/dL), urea 149 mg/dL (normal range: 10-50 mg/dL) and CRP 209.2 mg/L (normal range: 0.10–5 mg/L). Subsequently, she was hospitalized with Grade 3 renal impairment along with dehydration. An ECG showed left axis deviation. She was started on treatment with metronidazole, lactobacillus acidophilus, insulin aspart, isophane insulin human, metoprolol, electrolytes (unspecified), potassium chloride, furosemide, dexamethasone, ceftriaxone, hydroxyzine and drotaverine. On the same day (Study Day 298), diarrhea was considered resolved. On Study Day 300, chest X-ray showed 2.5 mm lesion in the right lung with little pleural effusion in the left lung. On Study Day 307, chest and pelvis CT was consistent with metastatic changes in bones and she was also suspected with renal cyst. During the hospitalization, she was also reported with renal colic (diagnostic test not reported) with lumbar pain. It was reported that following treatment, her condition improved. On Study Day 308, the event of renal impairment was considered resolved and she was discharged from the hospital on etamsylate, potassium chloride, metoprolol, drotaverine and dexamethasone. On Study Day 321, the event of urinary tract infection was considered resolved. On Study Day 337, the event of asthenia exacerbation resolved. On Study Day 360, the event of decreased appetite was considered resolved. The event of lymphedema remained unresolved at the time of study discontinuation.

Relevant laboratory work-up:

Study Day	Sodium Normal range: 136-146 mmol/L	Potassium Normal range: 3.5-5.1 mmol/L	Glucose Normal range: 70-99 mg/dL	Creatinine Normal range: 0.6-1.1 mg/dL	Urea Normal range: 10-50 mg/dL	CRP Normal range: 0.10-5 mg/L

*normal range: 132-145 mmol/L, **normal range: 74-106 mg/dL, ^normal range: 0.51-0.95 mg/dL, # normal range: 17-43 mg/dL

There was no change in study treatment due to the event of renal impairment.

The Investigator considered renal impairment, to be unrelated to ipatasertib and paclitaxel and related to other causes (unspecified).

On Study Day 849, study treatment was permanently discontinued due to symptomatic deterioration (deterioration of general health and recurrent anemia) with the last dose of paclitaxel and ipatasertib given on Study Day 828 and Study Day 834, respectively. The patient entered into the long-term follow-up.

Later, on the same day (Study Day 849), the patient withdrew consent from the study.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305252	Patient number	2116
Demographics:	78-year-old female (Race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		
Event 2 (PT) Categories:	Diarrhea SAE, AESI: Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T1cNXM0), approximately 15 years prior to study entry.

The patient was diagnosed with locally recurrent disease, approximately 3 years 4 months prior to study entry. She was diagnosed with metastatic disease on Study Day −183 with ER positive/PR unknown and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included left mediastinal lymph nodes and liver (segment V and VI). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right lumpectomy	Approximately 15 years prior to study entry	NA
Radiotherapy	Adjuvant	Right breast (50 cGy, 25 fractions)	Approximately 15 years prior to study entry	Approximately 15 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 15 years prior to study entry	Approximately 14 years prior to study entry

Cancer therapy	Metastatic	Exemestane and Everolimus	−833	−175
Cancer therapy	Metastatic	Palbociclib and Fulvestrant	−175	−83

The patient′s medical history included left breast cancer, contusion, skin abrasion and wrist fracture. Other surgical history included hysterectomy. Concurrent conditions included dyslipidemia, dyspnea, and restless legs syndrome.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

On Study Day 1, the patient started receiving loperamide (total daily dose: 4 mg, PO) for diarrhea.

Prior to onset of Grade 3 diarrhea (serious), the patient experienced multiple non-serious events of diarrhea detailed in the table below. Treatment included loperamide (details reported in table below), diosmectite and racecadotril.

Most extreme Grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
2	10	15	Related	Unrelated	Drug interrupted on Study Day 12 and resumed on Study Day 29 at a reduced dose of 300 mg	Cycle 1 Day 15 dose interrupted
2	35	52	Related	Unrelated	Drug interrupted on Study Day 37 and resumed on Study Day 44 at a reduced dose of 200 mg	Dose reduced to 65 mg/m^2 on Study Day 37
1	54	57	Related	Unrelated	None	None
1	68	69	Related	Unrelated	None	None
1	72	73	Related	Unrelated	None	None
2	75	79	Related	Unrelated	None	None

Event 1: Neuropathy peripheral (neuropathy)
Event 2: Diarrhea

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 71 and ipatasertib (200 mg) on Study Day 77.

On Study Day 85, the patient was diagnosed with Grade 2 (initial intensity) peripheral neuropathy (presenting symptoms not reported).

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 85 and ipatasertib (200 mg) on Study Day 95.

On Study Day 96, the patient experienced Grade 2 (initial intensity) diarrhea, Grade 3 nausea (non-serious, unrelated) and vomiting. On Study Day 97, she experienced Grade 2 asthenia (non-serious, related). She received loperamide (for detailed dosing please refer to table below) for diarrhea and treatment with diosmectite was maintained. No treatment was administered for asthenia. On Study Day 98, diarrhea improved to Grade 1. On Study Day 99, the patient experienced Grade 2 mucosal inflammation (non-serious, related). She further received metoclopramide for nausea and amphotericin B, fluconazole, and pantoprazole for mucosal inflammation.

On Study Day 103, the patient presented with Grade 4 vomiting (non-serious, unrelated), nausea, dehydration, alteration of general state and worsening of diarrhea to Grade 3. She was reported to have lost 2 kg weight in four days. Subsequently, she was hospitalized. Stool culture was performed (results not provided). It was reported that nausea and vomiting were probably due to mucosal inflammation. On the same day (Study Day 103), the event of peripheral neuropathy was reported to have worsened to Grade 3. No treatment was given for neuropathy peripheral. She received dietary advice for diarrhea. On Study Day 111, the events of nausea

and vomiting were considered resolved and she was discharged from the hospital. On Study Day 113, the event of asthenia and diarrhea resolved. On Study Day 141, the event of mucosal inflammation was considered resolved. The event of peripheral neuropathy remained unresolved at the time of study discontinuation.

Loperamide treatment details:

Diarrhea	4	PO	157	158
Diarrhea	2	PO	158	158
Diarrhea	2	PO	160	163
Diarrhea	2	PO	160	160
Diarrhea	2	PO	168	169

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 97 and was resumed on Study Day 99 and then again interrupted on Study Day 102 and resumed on Study Day 113.

Due to the event of peripheral neuropathy, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 99.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered peripheral neuropathy to be related to paclitaxel and unrelated to ipatasertib.

The patient experienced another episode of Grade 1 diarrhea (non-serious, related to ipatasertib) from Study Day 117 to Study Day 118. Treatment with diosmectite was maintained for diarrhea.

On Study Day 169, a radiographic response assessment showed disease progression with new lesions in liver. Subsequently, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 162. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatment	Start Day	Stop Day
Cyclophosphamide and epirubicin	176	288
Cyclophosphamide	330	434
Eribulin	470	673
Capecitabine	694	992
Etoposide	1028	–

On Study Day 1156, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	1	Non-serious	1	3	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304640	Patient number	2120
Demographics:	63-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Categories:	Pneumonitis SAE, Grade ≥ 3 pneumonitis		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR positive and HER 2 negative right breast cancer (TXNXMX, histological grade unknown), approximately 10 years prior to study entry followed by right partial mastectomy.

The patient was diagnosed with locally recurrent disease approximately 3 years prior to study entry followed by right simple mastectomy. On Study Day −656, she was diagnosed with metastatic disease with ER/PR positive and HER 2-negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included in midline liver (segment 7), soft tissue (porto-cavalis) and bone (multiple sclerotic lesions). The patient was assessed by the Investigator to have visceral crisis.

No other past cancer treatments were reported.

No medical history was reported. Surgical history included cholecystectomy. Concurrent conditions included asthma, hypothyroidism, hyperuricemia, hypertonia, type 2 diabetes mellitus, dyspepsia, and back pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included cetirizine, perindopril, levothyroxine, allopurinol, metformin, budesonide/formoterol, fecosterol /ipratropium, methylprednisolone, ivabradine, metamizole, paracetamol/tramadol, ascorbic acid/beta carotene/biotin/calcium/carbohydrates(unspecified)chloride/choline/chromium;copper/cyanocobalamin/fats (unspecified) fiber dietary/fluorine/folic acid/ iodine/ iron/ magnesium/ manganese/ molybdenum/ nicotinamide/pantothenic acid/ phosphorus/potassium/ proteins (unspecified)/pyridoxine/ riboflavin/selenium/ sodium/thiamine/vitamin D (unspecified);vitamin E (unspecified)/zinc, aceclofenac and anastrozole.

Event: Pneumonitis

Prior to the event of pneumonitis, the most recent dose of paclitaxel was administered on Study Day 158 and ipatasertib (300 mg) on Study Day 164.

On Study Day 167, the patient experienced fever (maximum body temperature: 40.1°C) and cough. On Study Day 172, X-ray was performed, and she was hospitalized with the diagnosis of Grade 2 pneumonitis. On the same day (Study Day 172), an ultrasound was also performed (results not reported). She received treatment with moxifloxacin and ongoing methylprednisolone. On Study Day 177, a repeat X-ray was performed (results not reported). On the following day (Study Day 178), the event of pneumonitis was considered resolved and she was discharged from the hospital.

Due to the event of pneumonitis, study treatment with ipatasertib was interrupted on Study Day 172 and was resumed at a reduced dose of 200 mg on Study Day 193; dose of paclitaxel was also reduced to 65 mg/m^2 from Study Day 193.

The Investigator considered pneumonitis to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 484, study treatment was permanently discontinued due to symptomatic deterioration (peripheral neuropathy) with the last dose of paclitaxel and ipatasertib given on Study Day 437 and Study Day 476, respectively. The patient entered into long-term follow-up.

On Study Day 725, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305633	Patient number	2122
Demographics:	70-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Categories:	COVID-19 SAE, AE leading to study treatment discontinuation, COVID-19 SAE		

The patient was randomized on Study Day 1.

The patient was diagnosed with lobular, poorly differentiated, ER/PR positive and HER2-negative metastatic left breast cancer (T3N1M1) on Study Day −35.

At screening, sites of disease involvement included mediastinum (left pre-tracheal nodule), ascites, bone (left scapula, ilium, and sacrum), and lymph node (left axillary),.

No past cancer treatment was reported.

No medical/surgical history was reported. The patient′s concurrent conditions included ascites, peripheral venous disease, anemia, and hypoalbuminemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included spironolactone.

Event: COVID-19 (COVID-19 infection)

Prior to the event of COVID-19, the most recent dose of paclitaxel was administered on Study Day 668 and ipatasertib (400 mg) on Study Day 671.

On Study Day 672, the presented to the emergency room due to fever (body temperature not reported). She denied any respiratory difficulty and had adequate oxygen saturation. A relevant diagnostic included hematology, urinalysis, and hepatic examination (results not reported) were performed. A rapid antigen test was positive for COVID-19. Subsequently, she was hospitalized with the diagnosis of mild Grade 1 COVID-19. She received treatment with ketoprofen, dimenhydrinate, ceftriaxone, azithromycin, and enoxaparin. On Study Day 673, a chest X-ray was normal. On Study Day 674, the event of COVID-19 was considered resolved and she was discharged from the hospital.

Due to this event, study treatment with paclitaxel and ipatasertib was permanently discontinued with the last dose given on Study Day 668 and Study Day 671, respectively. The patient entered into long-term follow-up.

The Investigator considered COVID-19, to be unrelated to ipatasertib, paclitaxel and related other cause.

On Study Day 721, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304640	Patient number	2135
Demographics:	59-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Rash AESI: Grade $\geq$ 3 rash		
Event 2 (PT) Category:	Dyspnea SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T3N1aM0), approximately 3 years 6 months prior to study entry.

On Study Day −38, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative in metastatic tissue. At screening, sites of disease involvement included liver (left S7 and 8) and bone (right scapula). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Cyclophosphamide, goserelin and letrozole	Approximately 3 years 5 months prior to study entry	Approximately 3 years prior to study entry
Surgery	Curative	Left simple mastectomy	Approximately 3 years prior to study entry	NA
Radiotherapy	Adjuvant	Breast (left chest wall) (5000 cGy)	Approximately 2 years 10 months prior to study entry	Approximately 2 years 9 months prior to study entry

No medical history or concurrent conditions were reported. Surgical history included tonsillectomy, abdominoplasty, and caesarean section.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event 1: Rash
Event 2: Dyspnea

Prior to the events of rash and dyspnea, the most recent dose of paclitaxel was administered on Study Day 209 and ipatasertib (400 mg) on Study Day 215.

On Study Day 223, the patient came to hospital for Cycle 9 Day 1 visit. She was noted with Grade 3 rash and received treatment with methylprednisolone and famotidine.

On Study Day 226, she presented to the hospital with heavy breathing and was hospitalized with Grade 3 dyspnea. Chest X-ray showed hydrothorax. A chest drain was placed, and 3000 mL of fluid was removed. No medications were given for dyspnea.

On Study Day 230, CT-scan showed disease progression with new lesions in mediastinal lymph nodes. On Study Day 231, the event of dyspnea resolved. On the same day (Study Day 231), chest drain was removed, and the patient was discharged from the hospital in a good condition. On Study Day 237, the event of rash resolved.

Due to the event of dyspnea, there was no change in study treatment; however, due to the event of rash, study treatment with ipatasertib and paclitaxel was interrupted.

On Study Day 237, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 209 and ipatasertib on Study Day 215. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	234	Ongoing

The Investigator considered rash to be unrelated to paclitaxel and related to ipatasertib and disease under study.

The Investigator considered dyspnea to be unrelated to ipatasertib and paclitaxel and related to disease under study.

On Study Day 938, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304786	Patient number	2136

Demographics:	48-year-old White male
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort:	Cohort B
Event 1 (PT) Category:	Anxiety SAE
Event 2 (PT) Category:	Alanine aminotransferase increased AESI: Grade $\geq$ 3 hepatotoxicity
Event 3 (PT) Category:	Nausea AE leading to study treatment discontinuation
Event 4 (PT) Category:	Asthenia AE leading to study treatment discontinuation
Event 5 (PT) Category:	Fatigue AE leading to study treatment discontinuation

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated ER/PR positive and HER2 negative, left breast cancer (T2N1M0), approximately 4 years prior to study entry.

On Study Day −172, the patient was diagnosed with metastatic disease (ER and PR status was unknown and HER2 status was not assessed in metastatic tissue). At screening, sites of disease involvement included lung (bilateral including left hilar and right subpleural regions). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left modified radical mastectomy	Approximately 3 years 10 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin and Cyclophosphamide	Approximately 3 years 8 months prior to study entry	Approximately 3 years 6 months prior to study entry
Cancer therapy	Adjuvant	Docetaxel	Approximately 3 years 5 months prior to study entry	Approximately 3 years 3 months prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 3 years 2 months prior to study entry	−172
Radiotherapy	Adjuvant	Left breast (5040 cGy)	Approximately 3 years prior to study entry	Approximately 2 years 11 months prior to study entry

The patient′s medical history included thrombosis. Other surgical history included tonsillectomy and cholecystectomy. Concurrent conditions included spondylitis, anxiety, and bipolar disorder.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received his first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), he experienced Grade 1 nausea and Grade 1 asthenia (both non-serious, related).

Concomitant medications ongoing at Study Day 1 included alprazolam and valproate.

Event 1: Anxiety (Anxiety crisis)

Prior to the event of anxiety, the most recent dose of paclitaxel was administered on Study Day 7 and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient presented with Grade 3 chest and lumbar pain (unrelated to ipatasertib), Grade 1 sweating (unrelated to ipatasertib), Grade 1 diarrhea (non-serious, related to ipatasertib), Grade 1 vomiting (non-serious, related to paclitaxel), Grade 1 nausea and worsening of his concurrent condition of anxiety to Grade 3, resulting in hospitalization. On the same day, the event of asthenia (non-serious, causality re-assessed as related to paclitaxel and unrelated to ipatasertib) worsened to Grade 2. Laboratory work-up was negative for creatine kinase (CK) and creatine kinase-MB (CKMB) enzymes (values not provided). Hematology and chemistry tests were considered not clinically significant. ECG and chest X-ray were normal. He received treatment with isosorbide dinitrate and treatment with alprazolam was maintained for

anxiety. Treatment for diarrhea included loperamide. No treatment was given for nausea, vomiting and asthenia. The event of vomiting was considered resolved on the same day (Study Day 11). On Study Day 12, the events of anxiety and asthenia were considered resolved and the patient was discharged from the hospital. On Study Day 13, diarrhea resolved.

Due to the event of anxiety, there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 12 and was resumed on Study Day 13.

The Investigator considered anxiety to be unrelated to ipatasertib and paclitaxel and related to concurrent illness.

Event 2: Alanine aminotransferase increased (ALT increased)

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 7 and ipatasertib (400 mg) on Study Day 13.

On Study Day 14, at scheduled Cycle 1 Day 15 visit, a laboratory work-up showed AST level at 76.4 U/L and ALT level at 228.8 U/L and the patient was noted with non-serious Grade 3 alanine aminotransferase increased. No treatment was administered for the event. On Study Day 27, the event of alanine aminotransferase increased was considered resolved.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 8-33 U/L	**ALT** Normal range: 4-36 U/L	**Bilirubin** Normal range: 2-21 μmol/L	**ALP** Normal range: 40-129 U/L
Screening	23	19.1	0.78	51
1	22	19.1	0.49	49
7	40	39	1.13	45
14	76.4	228.8	0.52	105
28	21.7	37.6	0.39	90

There was no change in study treatment due to the event of alanine aminotransferase increased.

The Investigator considered alanine aminotransferase increased to be unrelated to ipatasertib and paclitaxel and related to other causes (unspecified).

On Study Day 30, the patient experienced Grade 1 fatigue (non-serious, related to paclitaxel). On Study Day 43, fatigue worsened to Grade 2 and on Study Day 53 improved to Grade 1.

On Study Day 148, the event of nausea was considered resolved. On Study Day 158, the patient experienced another event of Grade 1 nausea (non-serious, related).

Event 3: Nausea

Event 4: Asthenia
Event 5: Fatigue

Prior to the event of nausea, the most recent dose of paclitaxel was administered on Study Day 237 and ipatasertib (300 mg) on Study Day 239.

On Study Day 240, the ongoing event of nausea worsened to Grade 2 (non-serious). The same day, the patient also experienced Grade 2 constipation (non-serious, unrelated) and Grade 2 muscle spasms (non-serious, related). The patient received treatment with metoclopramide and ondansetron for nausea, unspecified medication for muscle spasms and no treatment was given for constipation.

Prior to the events of asthenia and fatigue, the most recent dose of paclitaxel was administered on Study Day 237 and ipatasertib (300 mg) was administered on Study Day 244.

On Study Day 250, the ongoing events of asthenia and fatigue worsened to Grade 2 (both non-serious). No treatment was administered for the events of fatigue and asthenia. On Study Day 256, the event of muscle spasms was considered resolved. On Study Day 308, the events of nausea, constipation, asthenia, and fatigue were considered resolved.

Due to the events of nausea, asthenia and fatigue, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 280.

The Investigator considered nausea and asthenia to be related to ipatasertib and paclitaxel.

The Investigator considered fatigue to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 389, a radiographic response assessment showed disease progression.

On Study Day 393, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 384. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Anastrozole and goserelin	393	Ongoing

On Study Day 1120, the patient was permanently discontinued from the study as the LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Neck pain	1	Non-serious	281	282	Unrelated	Unrelated

Study Number/CRTN:	CO40016/307260	Patient number	2142
Demographics:	74-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Decreased appetite SAE		
Event 3 (PT) Category:	Erythema multiforme SAE		
Event 4 (PT) Category:	Decreased appetite SAE		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, left breast cancer (T1N0M0) on an unknown day. Her ER and PR status was unknown and HER2 status was not assessed.

The patient was diagnosed with metastatic disease approximately 4 years prior to study entry following left breast biopsy with ER/PR positive and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included left breast skin, bone (multiple metastatic lesions) and lymph nodes (mediastinal and right axillary; multiple lesions). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left partial mastectomy	Approximately 27 years prior to study entry	—
Cancer therapy	Adjuvant	Tamoxifen	Approximately 27 years prior to study entry	Approximately 26 years prior to study entry
Cancer therapy	Metastatic	Letrozole and palbociclib	Approximately 4 years prior to study entry	−652

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Fulvestrant and unspecified PI3KA-specific inhibitor	−596	−372
Cancer therapy	Metastatic	Exemestane and unspecified HDAC inhibitor	−337	−250
Cancer therapy	Metastatic	Toremifene and everolimus	−231	−56

No medical or surgical history was reported. The patient′s concurrent conditions included hypertension, dry eye, constipation, blood cholesterol increased, dry skin, glaucoma, and hyperglycemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. She also received prophylactic loperamide (2 mg) for diarrhea on Study Days 1-2.

Concomitant medications ongoing at Study Day 1 included amlodipine, telmisartan, rosuvastatin, magnesium oxide, denosumab, hyaluronate sodium and brinzolamide/timolol.

Event 1: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 7.

On Study Day 8, the patient was diagnosed with Grade 1 peripheral sensory neuropathy (signs and symptoms not reported). No treatment was reported for the event. On Study Day 163, the event of peripheral sensory neuropathy worsened to Grade 2, which remained unresolved at the time of patient's death (see narrative below).

Due to the event of peripheral sensory neuropathy, there was no change in treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 154.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

Event 2: Decreased appetite (Anorexia)

Prior to the event of decreased appetite, the most recent dose of paclitaxel was administered on Study Day 14 and ipatasertib (400 mg) on Study Day 15.

On Study Day 10, the patient experienced Grade 1 (initial intensity) diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (1 mg). On Study Day 14, she experienced Grade 1 vomiting (non-serious, related to ipatasertib), and the following day (Study Day 15), diarrhea worsened to Grade 2 (6 times/day). Loperamide dose was increased to 3 mg. On the same day (Study Day 15), she experienced Grade 1 nausea (non-serious, related to ipatasertib) and Grade 2 (initial intensity) decreased appetite. No treatment was reported for nausea and vomiting. On Study Day 16, the event of diarrhea improved to Grade 1 (1-2 times/day). Details regarding loperamide treatment are reported in the table below.

On Study Day 21, the patient presented with ongoing vomiting and diarrhea (2 times a day) and worsening of decreased appetite to Grade 3 resulting in hospitalization. Reportedly, worsening of decreased appetite was secondary to diarrhea and vomiting. She received treatment with calcium chloride dihydrate/potassium chloride/sodium acetate trihydrate/sodium chloride and amino acids unspecified/electrolytes unspecified/glucose/thiamine for decreased appetite and diarrhea. The same day (Study Day 21), vomiting resolved. She further received carbohydrates unspecified/potassium chloride/sodium chloride/sodium lactate, calcium chloride dihydrate/glucose/potassium chloride/sodium acetate, potassium chloride and lactomin. On Study Day 22, the event of decreased appetite improved to Grade 2 after ipatasertib interruption. On Study Day 23, nausea resolved, and the event of decreased appetite further improved to Grade 1. The patient was advised to not to have dinner. On Study Day 27, she resumed eating; however, diarrhea occurred again. Therefore, meal prohibition was advised. Further treatment for decreased appetite included cyanocobalamin/pyridoxine/thiamine and ascorbic acid. On Study Day 34, the patient started to have porridge and vegetable diet. The following day, fluid replacement was decreased. On Study Day 37, the event of diarrhea resolved. On Study Day 38, the patient did not require IV drip infusion. On Study Day 40, her food intake was increased. On Study Day 44, the event of decreased appetite resolved, and the patient was discharged from the hospital.

Due to the event of decreased appetite, study treatment with paclitaxel was interrupted on Cycle 2 Day 1 and Cycle 2 Day 8 and ipatasertib was interrupted from Study Days 22-48. Reportedly, as light headedness due to dehydration occurs in patients on anti-hypertensive medications, therefore, amlodipine and telmisartan were also interrupted.

The next dose of paclitaxel and ipatasertib (at reduced dose of 300 mg) was administered on Study Day 41 and Study Day 49, respectively. On Study Day 45, treatment with amlodipine and telmisartan were resumed.

Loperamide details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	1	PO	10	10
Diarrhea	2	PO	12	12
Diarrhea	1	PO	14	14
Diarrhea	3	PO	15	15

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	16	18
Diarrhea	3	PO	19	19
Diarrhea	6	PO	20	20
Diarrhea	2	PO	21	21
Diarrhea	5	PO	22	23
Diarrhea	2	PO	24	25
Diarrhea	2	PO	28	28
Diarrhea	4	PO	29	31
Diarrhea	2	PO	32	32

The Investigator considered decreased appetite to be unrelated to paclitaxel and related to ipatasertib.

Event 3: Erythema multiforme

Prior to the event of erythema multiforme, the most recent dose of paclitaxel was administered on Study Day 14 and ipatasertib (400 mg) on Study Day 21.

On Study Day 24, whilst hospitalized for the event of decreased appetite, the patient experienced pruritus (site unspecified) for which she received topical petrolatum. On Study Day 26, she experienced rash maculopapular on face, oral mucosa and whole body along with wheals, and was diagnosed with Grade 2 erythema multiforme (confirmed by clinical course of the event). She was started on fexofenadine. On the following day (Study Day 27), the event of erythema multiforme worsened to Grade 3, leading to prolongation of hospitalization. She was started on betamethasone, heparinoid and hydrocortisone. On an unspecified day, she also developed epidermolysis on palmar and dorsum of the hand. On Study Day 28, erythema gradually spread to buccal cavity and itching worsened. Skin biopsy was performed. Treatment with olopatadine was started and the event of erythema multiforme improved to Grade 2 on Study Day 29.

On Study Day 30, the patient had strong itching in buccal cavity and erythema on trunks and limbs became discolored. She also had scaling of skin. On Study Day 34, itching improved, erythema on face almost disappeared and was residual on forearms. However, scaling on whole body persisted. She further received treatment with white soft paraffin. On Study Day 37, the event of erythema multiforme further improved to Grade 1 with almost disappearance of erythema on whole body; however, the patient had scaling persisting on forearms and trunk. Epidermolysis on palmar and dorsum of the hand progressed. On Study Day 43, erythema disappeared and the same day, biopsy results showed interface dermatitis. The following day (Study Day 44), the patient was discharged from the hospital. She further received treatment with diphenhydramine. On Study Day 49, she again experienced pruritus. She received fexofenadine. On Study Day 63, the event of erythema multiforme was considered resolved.

Relevant laboratory work-up:

Study Day	**Eosinophils** Normal range: 0-10%
Screening	2.7
21	0.9*
23	1.3*
27	3.9*
29	3.6
34	11.1*
37	9.4
41	10.8
49	14.3
63	5.3

*Normal range not reported

Due to the event of erythema multiforme, there was no change in treatment with paclitaxel; however, ipatasertib remained interrupted and the next dose was given on Study Day 49 at a reduced dose of 300 mg.

The Investigator considered erythema multiforme to be unrelated to paclitaxel and related to ipatasertib.

Event 4: Decreased appetite (Anorexia; second episode)

Prior to the event of decreased appetite, the most recent dose of paclitaxel was administered on Study Day 154 and ipatasertib (300 mg) on Study Day 155.

On Study Day 145, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (details reported in table below). On Study Day 155, she experienced Grade 2 (initial intensity) decreased appetite. The following day (Study Day 156), she experienced Grade 1 nausea (non-serious, related to ipatasertib) for which she received treatment with metoclopramide. On Study Day 163, the event of decreased appetite worsened to Grade 3, leading to hospitalization. Laboratory work-up showed Grade 2 hypokalemia (potassium value not reported, non-serious, related to ipatasertib). She received treatment with potassium chloride of hypokalemia, sodium chloride and unspecified amino acids/electrolytes unspecified/glucose/thiamine of dehydration. The following day (Study Day 164), blood work-up showed CRP 2.64 and WBC count 3500 (units and normal range not reported). On Study Day 165, vitals showed body temperature 37.7°C. On Study Day 166, fever persisted, and the patient also experienced muddy stool. She was suspected with enteritis. She was put on fasting and treatment with unspecified amino acids/electrolytes unspecified/glucose/thiamine for dehydration was continued. On

Study Day 167, repeat laboratory work-up showed CRP 1.03 and WBC count 6700 (units and normal range not reported). On Study Day 168, the event of hypokalemia resolved. On Study Day 170, the patient passed normal stool, and she started having meals. On Study Day 174, after resumption of diet, she did not have any abdominal symptom or fever. Fluid replacement was stopped. On Study Day 183, the event of decreased appetite was considered resolved and the patient was discharged from the hospital. On Study Day 189, the events of diarrhea and nausea were considered resolved.

Loperamide details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	145	145
Diarrhea	4	PO	146	146
Diarrhea	2	PO	148	150
Diarrhea	4	PO	151	152
Diarrhea	6	PO	153	153
Diarrhea	2	PO	154	154
Diarrhea	6	PO	155	155
Diarrhea	4	PO	156	156
Diarrhea	2	PO	157	158
Diarrhea	4	PO	159	159
Diarrhea	2	PO	160	160
Diarrhea	6	PO	161	162
Diarrhea	4	PO	163	165
Diarrhea	2	PO	168	168

Due to the event of decreased appetite, paclitaxel was interrupted after Study Day 154 and never resumed; ipatasertib was interrupted from Study Day 169 and resumed at a reduced dose of 200 mg on Study Day 203.

The Investigator considered decreased appetite to be related to ipatasertib and paclitaxel.

On Study Day 254, radiographic response assessment showed disease progression with new lesions in lateral segment of liver.

On Study Day 268, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 245. The patient entered into the long-term follow-up

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Anastrozole and abemaciclib	294	384

On Study Day 457, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	1	Non-serious	1	7	Unrelated	Related

Study Number/CRTN:	CO40016/304880	Patient number	2148
Demographics:	74-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Categories:	Diarrhea SAE, AESI: Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Febrile neutropenia AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER positive, PR negative and HER2 negative left breast cancer (T2N0M0; histological grade unknown), approximately 6 years prior to study entry.

On Study Day −673, the patient was diagnosed with locally recurrent disease. On Study Day −278, she was diagnosed with metastatic disease with ER positive, PR negative and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included lung (multiple lesions in bilateral lower lobes). The patient was assessed by the Investigator to have endocrine resistant.

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Surgery	Curative	Left simple mastectomy	Approximately 6 years prior to study entry	NA
Cancer therapy	Adjuvant	Cyclophosphamide, methotrexate, and fluorouracil	Approximately 6 years prior to study entry	Approximately 5 years prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 5 years prior to study entry	−668
Surgery	Palliative	Left breast ″other″ surgery	−644	NA

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Tamoxifen	−617	−183
Radiotherapy	Adjuvant	Left supraclavicular lymph nodes and left chest wall (dose: 5000 cGy, 25 fractions)	−607	−573
Radiotherapy	Adjuvant	Breast (tumor bed) (dose: 1000 cGy, 5 fractions)	−572	−566
Surgery	Palliative	Left axillary lymph node dissection	−226	NA
Cancer therapy	Metastatic	Exemestane	−183	−91

No medical or surgical history was reported. Concurrent conditions included hypertension, dyslipidemia, angina pectoris and hypothyroidism.

At screening, the patient's ECOG Performance Status was 0.

Relevant laboratory work-up included:

Study Day	WBC count Normal range: 4-10 × $10^3/\mu L$	Neutrophil count Normal range: 2-7 × $10^3/\mu L$	Body temperature °C
Screening	4.69	2.49	36.5

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. She also received prophylactic loperamide (4 mg, PO) for diarrhea on Study Days 1-8.

Concomitant medications ongoing at Study Day 1 included atorvastatin, levothyroxine, acetylsalicylic acid, trimetazidine and rebamipide.

Event 1: Diarrhea
Event 2: Febrile neutropenia

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 7.

On Study Day 8, the patient experienced Grade 1 (initial intensity) diarrhea. On Study Day 21, she experienced Grade 1 nausea (non-serious, related to paclitaxel). She received treatment with loperamide (treatment details in the table below), tiropramide, diosmectite for diarrhea, metoclopramide, and cimetidine for nausea.

On Study Day 34, the patient experienced Grade 1 dizziness (non-serious, related to paclitaxel). No treatment was given for dizziness. On Study Day 121, the event of dizziness was considered resolved. On Study Day 160, the events of diarrhea and nausea worsened to Grade 2. She further received treatment with octreotide for nausea. On Study Day 166, the events of diarrhea and nausea improved to Grade 1.

Prior to the event of febrile neutropenia that led to ipatasertib and paclitaxel discontinuation, the patient was noted with multiple non-serious events of neutrophil count decreased detailed in the table below:

Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
4	14	21	Unrelated	Related	Treatment interrupted from Study Day 14 to Study Day 21 and the next dose was given on Study Day 22 at reduced dose of 300 mg	Cycle 1 Day 15 dose was interrupted, and the next dose given at a reduced dose of 65 mg/m^2 on Study Day 22
3	43	50	Unrelated	Related	Treatment interrupted from Study Day 43 to Study Day 49 and the next dose was given on Study Day 50 at reduced dose of 200 mg	Cycle 2 Day 15 dose was interrupted, and the next dose was given on Study Day 50 (Cycle 2 Day 22)

Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
3	57	70	Unrelated	Related	None	Cycle 3 administration was delayed, and one dose was interrupted; the next dose was given on Study Day 71
2	86	92	Unrelated	Related	None	Cycle 4 administration was delayed by a week and the next dose was given on Study Day 92

Prior to the event of febrile neutropenia, the most recent dose of paclitaxel was administered on Study Day 183 and ipatasertib (200 mg) on Study Day 186.

On Study Day 187, the event of diarrhea worsened to Grade 3, leading to hospitalization. On the same day (Study Day 187), the patient experienced fever (body temperature not reported). Her fecal occult blood test was negative. She was diagnosed with non-serious Grade 3 febrile neutropenia (neutrophil count not reported). She further received treatment with sodium chloride, paracetamol, glucose, piperacillin, metoclopramide and filgrastim for febrile neutropenia alanine/arginine/calcium chloride/glucose/glycine/histidine/isoleucine/leucine/lysine/magnesium chloride/methionine/phenylalanine/potassium phosphate dibasic/proline/serine/sodium acetate/sodium chloride/threonine/tryptophan, L-tyrosine/valine, amino acids/electrolytes (unspecified)/glucose, chromic chloride/copper sulfate/manganese sulfate/zinc sulfate, vitamins (unspecified), potassium chloride, paracetamol/tramadol and cefpodoxime for diarrhea. On Study Day 189, the event of febrile neutropenia (body temperature and neutrophil count not reported) was considered resolved. On Study Day 190, she was discharged from the hospital. On Study Day 191, the event of diarrhea improved to Grade 1. On Study Day 220, the events of diarrhea and nausea were considered resolved.

Loperamide details:

Diarrhea	12	PO	186	186

Due to the event of diarrhea, study treatment with paclitaxel was interrupted; ipatasertib was interrupted on Study Day 187 and the next dose was given on Study Day 191.

Due to the event of febrile neutropenia, study treatment with paclitaxel and ipatasertib was permanently discontinued with the last dose of paclitaxel and ipatasertib given on Study Day 183 and Study Day 192, respectively. The patient entered into long-term follow-up.

The Investigator considered diarrhea, to be unrelated to paclitaxel and related to ipatasertib.

The Investigator considered febrile neutropenia, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 335, radiographic response assessment showed disease progression with new lesions in left pelvis (sternum, T spine and left pelvic bone).

The patient received follow-up anti-cancer therapies as listed in table below:

Treatment	Start Day	Stop Day
Giredestrant	364	419
Doxorubicin and cyclophosphamide	435	Ongoing

On Study Day 745, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/305626	Patient number	2149
Demographics:	76-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Abdominal hernia SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T2N2M0; histological subtype: not otherwise specified), approximately 3 years prior to study entry.

On Study Day –61, the patient was diagnosed with metastatic disease, with ER/PR positive and HER2 negative in metastatic tissue. At screening, sites of disease involvement included left axillary adenopathy, left group IV ganglion conglomerate, left retro-pectoral adenopathy, left group VB adenopathy, left group III adenopathy, left pre-vascular adenopathy and adenopathy in mammary chain. The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy	Approximately 2 years 10 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide	Approximately 2 years 8 months prior to study entry	–909
Cancer therapy	Adjuvant	Paclitaxel	–880	–775
Cancer therapy	Adjuvant	Anastrozole	–766	–37

The patient's medical history included inguinal and umbilical hernia. Surgical history included surgery for inguinal and umbilical hernia. Concurrent condition included cataract.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event: Abdominal hernia

Prior to the event of abdominal hernia, the most recent dose of paclitaxel was administered on Study Day 177 and ipatasertib (200 mg) on Study Day 181.

On Study Day 184, the patient presented with abdominal pain. She was hospitalized with Grade 3 abdominal hernia (diagnostic details not available). An unspecified procedure/surgery was performed. She received treatment with paracetamol and simethicone. On Study Day 185, the event of abdominal hernia was considered resolved and she was discharged from the hospital.

Due to the event of abdominal hernia, study treatment with ipatasertib and paclitaxel was interrupted.

On Study Day 208, a radiographic response assessment showed disease progression.

On Study Day 253, study treatment was permanently discontinued as patient withdrew consent from the study. The patient received the last dose of paclitaxel on Study Day 177 and ipatasertib on Study Day 181.

The Investigator considered abdominal hernia to be unrelated to ipatasertib and paclitaxel and related to other causes (unspecified).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Vomiting	1	Non-serious	4	4	Related	Unrelated
Diarrhea	2	Non-serious	5	7	Related	Unrelated
Diarrhea	2	Non-serious	40	45	Related	Unrelated
Asthenia	2	Non-serious	57	62	Unrelated	Related
Urinary tract infection	2	Non-serious	97	111	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304622	Patient number	2150
Demographics:	76-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Categories:	Neutropenia SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated ER/PR positive, bilateral breast cancer (T2N1miM0; HER2 receptor status not assessed), approximately 7 years prior to study entry followed by left partial mastectomy.

The patient was diagnosed with locally recurrent disease approximately 3 years 6 months prior to study entry. She was diagnosed with metastatic disease on Study Day −151 with ER positive/PR negative and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included liver (bilateral lobe). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide	Approximately 7 years prior to study entry	Approximately 6 years prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 6 years prior to study entry	Approximately 3 years 5 months prior to study entry
Radiotherapy	Adjuvant	Left breast (5000 cGy and 6600 cGy, 33 fractions)	Approximately 6 years prior to study entry	Approximately 6 years prior to study entry

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Tamoxifen	Approximately 3 years 4 months prior to study entry	Approximately 3 years 2 months prior to study entry
Cancer therapy	Adjuvant	Anastrozole	Approximately 3 years 2 months prior to study entry	Approximately 2 years 8 months prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 2 years 8 months prior to study entry	Approximately 1 years 6 months prior to study entry
Cancer therapy	Adjuvant	Fulvestrant	−509	−56

No medical or other surgical history was reported. Concurrent conditions included hypertension, urinary incontinence, carpal tunnel syndrome, diabetes mellitus, hyperuricemia and hyperlipidemia.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included hydrochlorothiazide/telmisartan, acetylsalicylic acid/glycine, solifenacin, pregabalin, metformin, allopurinol, rosuvastatin and bisoprolol.

On Study Day 1, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received loperamide (total daily dose: 4 mg).

Event: Neutropenia

Prior to the event of neutropenia, the most recent dose of paclitaxel was administered on Study Day 7 and ipatasertib (400 mg) on Study Day 8.

On Study Day 7, a laboratory work-up showed creatinine 196 μmol/L (normal range: 49-90 μmol/L), urea 19.7 mmol/L (normal range: 2.8-8.1 mmol/L) and the patient was diagnosed with Grade 2 renal failure (non-serious, related to ipatasertib). She received hydration with sodium chloride.

On Study Day 9, the patient experienced fever (body temperature 38.3°C), shivering, and confusion. Her ECOG Performance Status was 3 and blood pressure was 130/85 mmHg. On physical examination, she was conscious and anicteric without cyanosis. She had overall deterioration and could not walk properly. Brain CT-scan done due to suspected stroke or metastasis was normal. A laboratory work-up was performed, and she was noted with Grade 2 hyperglycemia (non-serious, related to ipatasertib; glucose 13.2 mmol/L; normal range: 3-5.6 mmol/L) and Grade 3 neutropenia (neutrophil count 0.91 x 10^9/L, normal range not provided). The patient had high creatine kinase, myoglobin and troponin value (values not provided). Subsequently, she was hospitalized. She received treatment with tiapride,

piperacillin/tazobactam sodium, spironolactone, and furosemide for neutropenia. No treatment was given for hyperglycemia. On Study Day 10, she was diagnosed with Grade 3 rhabdomyolysis (non-serious, related to ipatasertib). On Study Day 11, the event of rhabdomyolysis was considered resolved without any treatment. On Study Day 12, the event of neutropenia was considered resolved. On Study Day 31, the patient was discharged from the hospital. It was reported that she was feeling much better after one week and could walk with help. The events of diarrhea, renal failure and hyperglycemia were reported as unresolved at the time of patient's death (see narrative below).

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4-10 $\times$ 10^9/L	**Neutrophil count** Normal range: 2-7 $\times$ 10^9/L
Screening	4.92	2.66
7	4.13	1.87
9	—	0.91*

*Normal range not reported

Due to the event of neutropenia, study treatment with ipatasertib and paclitaxel was permanently discontinued on Study Day 46 with the last dose of paclitaxel administered on Study Day 7 and ipatasertib on Study Day 8. The patient entered into long-term follow-up.

The Investigator considered neutropenia to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 57, a radiographic response assessment showed disease progression with new lesions in liver (bilateral lobes).

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Paclitaxel and carboplatin	77	84

On Study Day 89, the patient died due to disease progression. An autopsy was not performed.

No other AEs were experienced by the patient during the study.

Study Number/CRTN:	CO40016/304332	Patient number	2160
Demographics:	51-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Erysipelas SAE		

The patient was randomized on Study Day 1.

The patient was diagnosed with lobular, moderately differentiated, ER positive, PR negative and HER2 negative metastatic left breast cancer (T4N3M1) on Study Day −27.

At screening, sites of disease involvement included bone (L2 and TH7), bilateral breast, liver (segment VI), lymph node (multiple lesions in left axillary, left upper sub clavicular and clavicular, left interpectoral, mediastinal, and right axillary) and right pleural effusion. The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatment was reported.

The patient′s medical history included Hodgkin′s disease, skin cancer (left breast) and pneumonia. Surgical history included lung lobectomy (left lower lobe), Caesarean section and female sterilization. Concurrent conditions included osteochondrosis, scoliosis, uterine leiomyoma, autonomic nervous system imbalance and anemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included bisoprolol.

Event: Erysipelas (erysipelas of right leg)

Prior to the event of erysipelas, the most recent dose of paclitaxel was administered on Study Day 401 and ipatasertib (400 mg) on Study Day 403.

On Study Day 404, the patient experienced fever (body temperature 39°C), fatigue and was noted with erythematosus rash and edema in right leg. Subsequently, she was diagnosed with Grade 3 erysipelas. On Study Day 407, she was hospitalized. Her WBC count was 12.5×10^9/L (normal range not reported). She received treatment with ceftriaxone, clemastine, diosmin/hesperidin, phospholipids, probiotics (unspecified) and diclofenac for the event of

erysipelas. On Study Day 419, the event of erysipelas was considered resolved and she was discharged from the hospital.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4-9 × 10^9/L	**Neutrophil count** Normal range: 1.96-6.93 × 10^9/L	**Body temperature** °C
Screening	7.46	5.55	36.5
404	—	—	39
407	12.5*	—	—

*Normal range not reported

Due to the event of erysipelas, there was no change in study treatment with ipatasertib, however, Cycle 15 Day 15 of paclitaxel was not administered, and the next dose was given on Study Day 422.

The Investigator considered erysipelas, to be unrelated to ipatasertib and paclitaxel and related to concurrent illness (unspecified).

On Study Day 555, a radiographic response assessment showed disease progression with new lesions in right breast, right pleura, and bones. Subsequently, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose administered on Study Day 512 and Study Day 534 respectively. The patient entered into long-term follow-up.

On Study Day 582, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / non-serious**	**Onset Day**	**Resolution Day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Diarrhea	1	Non-serious	12	14	Related	Unrelated

Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Chronic gastritis SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER positive/PR positive and HER 2-receptor equivocal right breast cancer (T1aN0M0) approximately 6 years prior to study entry, followed by right simple mastectomy.

On Study Day −979, the patient was diagnosed with locally recurrent disease. On Study Day −8, she was diagnosed with metastatic disease with ER /PR positive and HER 2-receptor negative disease in metastatic/recurrent tissue. At screening, sites of disease involvement included lateral aspect of right breast and lung (right upper lobe, lateral segment of right middle lobe, multiple pulmonary nodules in bilateral lung parenchyma and mediastinum lymphadenopathy in right hilar area). The patient was assessed by the Investigator to have endocrine resistant disease and visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Tamoxifen	Approximately 6 years prior to study entry	Approximately 4 years prior to study entry
Radiotherapy	Adjuvant	Right breast (dose unknown, 45 fractions)	Approximately 6 years prior to study entry	Approximately 6 years prior to study entry

The patient′s medical history included ovarian neoplasm. Surgical history included hysterosalpingogram-oophorectomy. Concurrent conditions included diabetes mellitus and breast injury.

At screening, the patient′s ECOG performance status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing on Study Day 1 were reported. The patient received prophylactic loperamide (4 mg, PO) for diarrhea on Study Days 1-4.

On Study Day 5, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide. On Study Day 6, the event of diarrhea improved to Grade 1. On Study Day 15, the event of diarrhea was considered resolved.

Event 1: Diarrhea
Event 2: Chronic gastritis

Prior to the event of diarrhea, the most recent dose paclitaxel was administered on Study Day 36 and ipatasertib (400 mg) on Study Day 41.

On Study Day 42, the patient experienced non-serious Grade 1 diarrhea (initial intensity). She received treatment with loperamide (details in the table below). On Study Day 99, she experienced Grade 2 weight decreased (non-serious, unrelated).

Prior to the event of chronic gastritis, the most recent dose of paclitaxel was administered on Study Day 99 and ipatasertib (400 mg) on Study Day 104.

On Study Day 105, the patient complained of post-prandial epigastric pain since 3 weeks and she was diagnosed with Grade 2 (initial intensity) chronic gastritis. On Study Day 112, esophagogastroduodenoscopy showed reflux esophagitis (Grade IA), shallow gastric ulcers, gastric polyps and duodenitis. On Study Day 115, the event of chronic gastritis improved to Grade 1. On Study Day 135, the event of diarrhea worsened to Grade 3. On the following day (Study Day 136), the event of diarrhea improved to Grade 2

On Study Day 137, in the morning, she experienced severe epigastralgia, abdominal bloating and acid regurgitation after eating. On the same day (Study Day 137), at 18:00 hours, the event of chronic gastritis worsened to Grade 3, leading to hospitalization. Upon hospitalization, her vitals showed body temperature 37°C, heart rate 92 beats/minute, respiratory rate 22 breaths/min and blood pressure 128/80 mmHg. Upon physical examination, her abdominal was soft with dull and colic epigastric pain migrating to right upper quadrant which improved on bending knee. On auscultation, hypoactive bowel sound were heard. Laboratory work-up showed elevated ALP 118 U/L (normal range: 35-104 U/L), GGT 146 U/L (normal range not reported) and Grade 2 hypokalemia (potassium 3.0 mmol/L, normal range: 3.7-5.3 mmol/L; non-serious, unrelated). Her amylase/lipase and troponin I were within normal range. Standing abdominal X-ray showed no free air; however, some air-fluid level at intestine. She received treatment with potassium chloride, pantoprazole and morphine. Reportedly, due to suspected ileus, probably due to ongoing loperamide, frequency of loperamide was changed to as needed, which the patient did not use as the event of diarrhea improved Grade 1 on Study Day 138. She was started on clear liquid diet and then advanced to bland diet. Her abdominal pain was improving, and she could tolerate food. She further received treatment with lansoprazole, aluminum hydroxide/calcium carbonate/magnesium carbonate/oxetacaine. On Study Day 139,

upper abdominal ultrasound showed multiple new liver lesions (up to 1.6 cm), with no evidence of cholecystitis or common bile duct (CBD) dilatation. On Study Day 140, the event of hypokalemia (potassium value not reported) was considered resolved. On Study Day 141, the event of chronic gastritis improved to Grade 2. On the same day (Study Day 141), the event of diarrhea was considered resolved and she was discharged from the hospital.

On Study Day 143, the patient again experienced Grade 1 diarrhea (non-serious, related to ipatasertib) and Grade 1 lipase increased (non-serious, unrelated; lipase: 86 U/L, normal range: 13-60 U/L). She further received treatment with metoclopramide, *Bifidobacterium bifidum/Enterococcus faecalis/Lactobacillus acidophilus* and pancreatin for chronic gastritis. On Study Day 227, the event of lipase increased was considered resolved (lipase: 36 U/L). On Study Day 255, the event of chronic gastritis was considered resolved. The events of weight decreased, and Grade 1 diarrhea remained unresolved at the time of study discontinuation.

Loperamide details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	6	PO	5	5
Diarrhea	4	PO	6	15
Diarrhea	4	PO	16	21
Diarrhea	2	PO	22	23
Diarrhea	2	PO	29	42
Diarrhea	4	PO	43	56
Diarrhea	4	PO	57	84
Diarrhea	4	PO	85	114
Diarrhea	4	PO	115	135
Diarrhea	4	PO	143	170
Diarrhea	4	PO	171	196
Diarrhea	4	PO	197	226
Diarrhea	4	PO	227	254
Diarrhea	4	PO	255	282
Diarrhea	4	PO	283	Ongoing

Due to the event of diarrhea, there was no change in the study treatment with paclitaxel, however, dose of ipatasertib was reduced to 300 mg on Study Day 143.

There was no change in the study treatment due to the event of chronic gastritis.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

The Investigator considered chronic gastritis to be unrelated to ipatasertib and paclitaxel and related to other causes (unspecified).

On Study Day 338, the patient withdrew consent from study treatment (physician discussed with the patient, the options to continue current clinical trial vs switching to alternative treatment with palbociclib and anastrozole, patient elected to discontinue current trial) with the last dose of paclitaxel administered on Study Day 324 and ipatasertib on Study Day 332. The patient entered into long-term follow up.

On Study Day 531, the patient withdrew consent from the study.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Alopecia	2	Non-serious	23	Unresolved	Unrelated	Related

Study Number/CRTN:	CO40016/305629	Patient number	2201
Demographics:	68-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Categories:	Diarrhea SAE, AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Categories:	Diarrhea SAE, AESI: Grade ≥ 3 diarrhea		
Event 3 (PT) Categories:	Enterocolitis SAE, AESI: Grade ≥ 2 enterocolitis/colitis		
Event 4 (PT) Category:	Intestinal obstruction SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2-negative bilateral breast cancer (T2N1M0), approximately 9 years prior to study entry followed by bilateral axillary dissection.

On Study Day −29, the patient was diagnosed with metastatic disease with ER positive/PR unknown and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included nodal liver, bilateral lung and mediastinal ganglion. The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/ Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Paclitaxel, cyclophosphamide, doxorubicin and exemestane	Approximately 9 years prior to study entry.	Approximately 8 years prior to study entry.
Radiotherapy	Neo-adjuvant	Breast (66cGy: 66 fractions)	Approximately 8 years prior to study entry.	Approximately 8 years prior to study entry
Radiotherapy	Adjuvant	Armpit lymph node (50 cGy 50 fractions)	Approximately 8 years prior to study entry.	Approximately 8 years prior to study entry

Type of treatment	Therapy Setting/ Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Anastrozole	Approximately 6 years prior to study entry	–725

The patient's medical history included asymptomatic bacteriuria. No surgical history and concurrent conditions were reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

On Study Day 2, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (2 mg, PO). On Study Day 7, the event of diarrhea was considered resolved.

On Study Day 11, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (2 mg, PO). On Study Day 17, the event of diarrhea improved to Grade 1. On Study Day 18, she experienced Grade 1 decreased appetite (related to paclitaxel). No treatment was given for event of decreased appetite. On Study Day 30, the event of diarrhea was considered resolved.

On Study Day 37, the patient experienced Grade 1 mucosal inflammation (non-serious, related to paclitaxel). No treatment was given for this event.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 36 and ipatasertib (400 mg) on Study Day 37.

On Study Day 38, the patient experienced Grade 1 (initial intensity) diarrhea. She received treatment with loperamide (details in the table below). On Study Day 46, the event of mucositis was considered resolved.

On Study Day 79, the event of diarrhea (associated with oral intolerance) worsened to Grade 3, leading to hospitalization. Treatment with loperamide was maintained and she also received hydration therapy. On Study Day 80, the event of diarrhea was considered resolved. On Study Day 81, the event of decreased appetite was considered resolved. On Study Day 83, she was discharged from the hospital.

Loperamide details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	2	6
Diarrhea	2	PO	15	16
Diarrhea	2	PO	19	20
Diarrhea	4	PO	38	67
Diarrhea	4	PO	91	92
Diarrhea	2	PO	96	98
Diarrhea	4	PO	106	107

Due to the event of diarrhea, study treatment with ipatasertib was interrupted on Study Day 83 and Cycle 4 Day 1 of paclitaxel was delayed. The next dose of paclitaxel and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 90.

The investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

Event 2: Diarrhea
Event 3: Enterocolitis
Event 4: Intestinal obstruction

Prior to the events of diarrhea, enterocolitis and intestinal obstruction, the most recent dose of paclitaxel was administered on Study Day 161 and ipatasertib (300 mg) on Study Day 166.

On Study Day 173, the patient experienced abdominal pain and Grade 3 diarrhea. On Study Day 174, she was hospitalized for antibiotic management and hydration. She received treatment with ceftriaxone, hyoscine, metamizole and morphine. On Study Day 176, the event of diarrhea was considered resolved, however due to abdominal pain she remained hospitalized. On Study Day 177, a CT scan was performed and she was diagnosed with Grade 3 enterocolitis and Grade 4 intestinal obstruction, leading to prolonged hospitalization. The event of enterocolitis was considered to cause significant disability. She further received treatment with meropenem and vancomycin. On Study Day 183, the events of enterocolitis and intestinal obstruction were considered resolved and she was discharged from the hospital.

Due to the events of diarrhea, enterocolitis and intestinal obstruction, study treatment with paclitaxel and ipatasertib was interrupted after Study Day 161 and Study Day 166, respectively.

The investigator considered diarrhea to be related to paclitaxel and unrelated to ipatasertib.

The investigator considered enterocolitis and intestinal obstruction to be related to ipatasertib and paclitaxel.

On Study Day 224, study treatment with paclitaxel and ipatasertib was permanently discontinued as per physician′s decision (patient presented adverse event of Grade 3 colitis, which led to other complications and its determinant as limiting toxicity) with the last dose of paclitaxel administered on Study Day 161 and ipatasertib on Study Day 166. The patient entered into long-term follow up.

On Study Day 601, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/318958	Patient number	2209
Demographics:	59-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Cellulitis SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal well differentiated ER positive, PR negative, and HER2-negative left breast cancer (T1cN0M0) approximately 7 years prior to study entry, following left sentinel lymph node biopsy and left partial mastectomy performed on the same day.

On Study Day −893, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER 2-not assessed in metastatic tissue. At screening, sites of disease involvement included bilateral lung, lymph nodes (left axillary, and left supraclavicular), and bone (midline sternum). The patient was assessed by the Investigator to have endocrine resistant.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Left breast (dose unknown)	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 7 years prior to study entry	−900
Cancer therapy	Metastatic	Letrozole	−884	−642
Cancer therapy	Metastatic	Fulvestrant	−641	−472
Cancer therapy	Metastatic	Letrozole and palbociclib (11 cycles)	−443	−130
Cancer therapy	Metastatic	Exemestane and everolimus	−121	−35

No medical/surgical history was reported. The patient′s concurrent conditions included pneumonia, atrial septal defect, and tumor pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

On Study Day 83, the patient experienced Grade 1 lymphedema of left arm (non-serious, unrelated). No treatment was given for the event.

Event: Cellulitis (Cellulitis; left arm)

Prior to the event of cellulitis, the most recent dose of paclitaxel was administered on Study Day 911 and ipatasertib (400 mg) on Study Day 916.

On Study Day 917, the patient′s left arm was hot, and she experienced fever (body temperature 40°C). On Study Day 918, laboratory work-up showed WBC count 14.54 $\times$ 10^9/L (normal range: 3.3-8. 6 $\times$ 10^9/L), and C-reactive protein 18.15 mg/dL (normal range: $<$ 0.14 mg/dL). A quantitative antigen test for SARS-CoV-2 was negative. She was diagnosed with Grade 3 cellulitis. On Study Day 919, she was hospitalized due to cellulitis. She received treatment with ibuprofen, cefazolin, and cefaclor. On Study Day 926, she was discharged from the hospital. On Study Day 932, the event of cellulitis was considered resolved. The event of lymphedema remained unresolved at the time of study discontinuation.

Due to this event, Cycle 34 of the study treatment with paclitaxel was delayed and study treatment with ipatasertib was interrupted after Study Day 917. The next dose was given on Study Day 932.

Relevant lab values are listed in the table below:

Study Day	**WBC count** (normal range: 3.3-8.6 $\times$ 10^9/L)	**Neutrophils** (normal range: 45-70%)	**Lymphocytes** (normal range: 20-45%)	**C-reactive protein** (normal range: $<$ 0.14 mg/dL)
Screening	5.67	58.2	32.1	
918	14.54	95.2*	4^	18.15
922	3.8	52.6*	32.4	2.53
926	3.28	–	–	0.51
932	4.97	–	–	0.53

*normal range: 39.7-70.6% and ^normal range: 23.1-49.9%

The Investigator considered cellulitis, to be unrelated to ipatasertib and paclitaxel and related to other cause (ongoing lymphedema).

On Study Day 1290, symptomatic deterioration assessment showed elevation of CEA and CA 15-3.

On Study Day 1296, study treatment and study was permanently discontinued due to symptomatic deterioration with the last dose of paclitaxel administered on Study Day 1275 and ipatasertib on Study Day 1281.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304792	Patient number	2218
Demographics:	58-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Eyelid edema SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal and ″other″ histological subtype, poorly differentiated, ER/PR positive and HER2 negative, left breast cancer (T2N1M0), approximately 3 years 6 months prior to study entry.

On Study Day –46, the patient was diagnosed with metastatic disease with ER and PR status was unknown and HER2 status was not assessed in metastatic tissue). At screening, sites of disease involvement included lung (expansive pulmonary formation inferior lingula, bilateral

solid, medullary and cortical pulmonary nodular formations, and expansive formation amorphous in correspondence with the right hilar region accompanying peri-bronchovascular bundles in the medial aspect of the anterior segment of the right upper lobe), lymph nodes (pre vascular-lymphadenopathy, prominent lymph nodes and enlargement in several mediastinal chains as well as bilateral hilar lymph nodes and retrocrural, peri-gastric, celiac, superior mesenteric, left para-aortic and inter-aortocaval prominent lymph nodes), and liver (nodular lesions). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left modified radical mastectomy	Approximately 3 years 5 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide and docetaxel	Approximately 3 years 5 months prior to study entry	Approximately 2 years 10 months prior to study entry
Radiotherapy	Adjuvant	Left breast (dose unknown, 25 fractions)	Approximately 1 year 9 months prior to study entry	Approximately 1 year 8 months prior to study entry
Cancer therapy	Adjuvant	Anastrozole	Approximately 1 years 8 months prior to study entry	−32

No medical or other surgical history was reported. Concurrent condition included dyspnea.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event: Eyelid edema (Bi-palpebral edema)

On Study Day 45, the patient received ipatasertib (400 mg) and Cycle 2 Day 8 of paclitaxel as scheduled. Within 24 hours after the end of paclitaxel infusion, the patient experienced Grade 2 urticaria (non-serious, related to paclitaxel) and hypersensitivity reaction (both considered as systemic infusion reaction) manifested with Grade 2 eyelid edema (serious; medically significant) and throat pruritus. She received treatment with hydrocortisone. On the same day (Study Day 45), the events of urticaria and eyelid edema were considered resolved.

There was no change in study treatment due to the event of eyelid edema.

The Investigator considered eyelid edema to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 115, a radiographic response assessment showed disease progression with new lesions in bone (skullcap, manubrium and sternal body, several vertebrae, sacrum, iliac bilaterally, lower branch of the left pubis and heterogeneous uptake in costal arches).

On Study Day 122, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 108 and ipatasertib on Study Day 113. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Fulvestrant	133	296
Denosumab and palbociclib	199	296
Cisplatin	324	394

On Study Day 470, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	8	31	Related	Related
Alopecia	2	Non-serious	21	Unresolved	Unrelated	Related
Asthenia	1	Non-serious	24	221	Unrelated	Related
Diarrhea	2	Non-serious	60	61	Related	Related

Back pain	1	Non-serious	115	221	Unrelated	Unrelated

1.4 NARRATIVES FOR PATIENTS WHO EXPERIENCED ADVERSE EVENTS LEADING TO STUDY TREATMENT DISCONTINUATION

Study Number/CRTN:	CO40016/307264	Patient number	2003
Demographics:	69-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Stomatitis AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Vomiting AE leading to study treatment discontinuation		

The patient was randomized on Study Day −2.

The patient was diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative metastatic right breast cancer (T4bN3aM1) on Study Day −323.

At screening sites of disease involvement included liver (multiple lesions including S3 and S4) and bone (multiple). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Letrozole	−294	−80
Surgery	Palliative	Right partial mastectomy and axillary sampling of lymph node	−209	—

The patient's medical history included nausea. No other surgical history was reported. Concurrent condition included seasonal allergy.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

No concomitant medications ongoing at Study Day 1 were reported.

On Study Day 2, the patient experienced Grade 2 nausea (non-serious, related).

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 8.

On Study Day 9, the patient experienced non-serious Grade 2 diarrhea (intermittent). She received treatment with loperamide (details reported in table below) for diarrhea. On Study Day 10, she experienced Grade 2 vomiting (non-serious, related). She received treatment with ramosetron, metoclopramide and carbohydrates/potassium chloride/sodium chloride/sodium lactate for nausea and vomiting. On Study Day 23, the event of diarrhea improved to Grade 1. On Study Day 30, the event of diarrhea again worsened to Grade 2. On Study Day 37, the events of nausea and vomiting were considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	4	PO	1	4
Diarrhea	4	PO	18	18
Diarrhea	4	PO	26	26
Diarrhea	2	PO	29	29
Diarrhea	4	PO	30	31
Diarrhea	2	PO	32	32
Diarrhea	4	PO	33	33
Diarrhea	2	PO	50	56

Event 2: Stomatitis
Event 3: Vomiting

Prior to the events of stomatitis and vomiting, the most recent dose of paclitaxel was administered on Study Day 50 and ipatasertib (400 mg) on Study Day 51.

On Study Day 52, the patient experienced non-serious Grade 1 stomatitis and Grade 1 vomiting. No treatment was reported for these events. On Study Day 53, the event of vomiting was considered resolved. On Study Day 56, the ongoing event of diarrhea was considered resolved. On Study Day 59, the event of stomatitis was considered resolved.

Due to the events of diarrhea, stomatitis and vomiting, there was no change in study treatment with paclitaxel; however, ipatasertib was permanently discontinued with the last dose administered on Study Day 54.

The Investigator considered diarrhea, stomatitis, and vomiting, to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 386, a radiographic response assessment showed disease progression with new lesion in liver (right S5).

On Study Day 412, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose administered on Study Day 384. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Eribulin	414	958
Fulvestrant and Palbociclib	972	Ongoing

On Study Day 1384, the patient was discontinued from the study as per physician's decision (study was terminated by the Sponsor). Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/305300	Patient number	2012
Demographics:	54-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER2-negative left breast cancer (T2N1miM0), approximately 7 years prior to study entry.

On Study Day −31, the patient was diagnosed with metastatic disease with ER positive, PR negative and HER2-negative disease in metastatic tissue. At screening, sites of disease involvement included bone (sternum), liver (segment V and VII), left lung (lingula) and right hilar lymph node. The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	″Other″ surgery of left breast and left axillary lymph node sampling	Approximately 7 years prior to study entry	NA
Cancer therapy	Adjuvant	Docetaxel, doxorubicin, and cyclophosphamide	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 7 years prior to study entry	−28

No medical or other surgical history was reported. Concurrent conditions included hypercholesterolemia, bone pain and spinal pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included loperamide, lorazepam, omeprazole, simvastatin and tramadol.

On Study Day 106, the patient developed Grade 1 palmo-plantar neuropathy (preferred term: peripheral neuropathy; non-serious, related to paclitaxel; symptoms not reported). On Study Day 299, the event of neuropathy peripheral was considered resolved without any

treatment. On Study Day 314, she again developed Grade 1 (initial intensity) palmo-plantar neuropathy (non-serious, related to paclitaxel). No treatment was administered for this event. On Study Day 454, palmo-plantar neuropathy worsened to Grade 2. On Study Day 455, dose of paclitaxel was reduced to 65 mg/m^2. On Study Day 488, the event of neuropathy peripheral was considered resolved.

Event: Neuropathy peripheral (palmo-plantar neuropathy)

Prior to the event of Grade 2 neuropathy peripheral which led to paclitaxel discontinuation, the most recent dose of paclitaxel was administered on Study Day 553 and ipatasertib (300 mg) on Study Day 559.

On Study Day 566, the patient developed non-serious Grade 2 palmo-plantar neuropathy (preferred term: **neuropathy peripheral**; presenting signs and symptoms not reported). No treatment was reported for this event. On Study Day 593, the event of neuropathy peripheral improved to Grade 1. On Study Day 788, the event of neuropathy peripheral was considered resolved.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 553.

The Investigator considered neuropathy peripheral, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 894, a radiographic response assessment showed disease progression.

On Study Day 901, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of ipatasertib given on Study Day 895. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Camizestrant and Palbociclib	929	984
Capecitabine	1028	Ongoing

On Study Day 1112, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/305245	Patient number	2017
Demographics:	52-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Neurotoxicity AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with lobular, ER/PR positive and HER2 negative right breast cancer (T2N1M0; histological grade unknown) approximately 4 years prior to study entry, followed by right modified radical mastectomy.

On Study Day −420, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included

pleura (right parietal, right posterior and bilateral), para-sternal subcutaneous nodule and peritoneum (peritoneal carcinomatosis). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Docetaxel, doxorubicin and cyclophosphamide	Approximately 4 years prior to study entry	Approximately 3 years 9 months prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 3 years 8 months prior to study entry	Approximately 1 year prior to study entry
Cancer therapy	Metastatic	Letrozole and goserelin	Approximately 1 year prior to study entry	Approximately 7 months prior to study entry

No medical or other surgical history was reported. Concurrent conditions included sarcoidosis, hypertension and gamma-glutamyltransferase increased.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included prednisone, codeine, paracetamol, atenolol, citalopram and lormetazepam.

Event: Neurotoxicity (neurotoxicity in hands and feet)

Prior to the event of neurotoxicity, the most recent dose of paclitaxel was administered on Study Day 203 and ipatasertib (400 mg) on Study Day 209.

On Study Day 210, the patient was reported with non-serious Grade 2 neurotoxicity in hands and feet (signs and symptoms not provided). No details regarding evaluation was provided. No treatment was reported for the event. The event of neurotoxicity remained unresolved at the time of patient′s death (see narrative below).

Due to the event of neurotoxicity, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 210.

The Investigator considered neurotoxicity to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 276, a radiographic response assessment showed disease progression with new lesions in liver (hepatic parenchyma) and bilateral pleural effusion.

On Study Day 296, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of administered on Study Day 271. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Abemaciclib	297	458
Surgery (palliative; Other unspecified; site: breast)	416	NA
Liposomal doxorubicin and cyclophosphamide	464	Ongoing

On Study Day 537, the patient died due to disease progression. It was unknown whether an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/304776	Patient number	2019
Demographics:	46-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Neutrophil count decreased AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, ER positive/PR negative and HER2 negative left breast cancer (T2NXM0; histological grade unknown), approximately 5 years 6 months prior to study entry following left breast biopsy.

On Study Day −146, the patient was diagnosed with metastatic disease with ER positive/ PR negative and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included chest (left parasternal region and left anterior mediastinum), bone (multiple) and bilateral lung (multiple nodules). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Cyclophosphamide, epirubicin and fluorouracil	Approximately 5 years prior to study entry	Approximately 5 years prior to study entry
Cancer therapy	Neo-adjuvant	Docetaxel	Approximately 5 years prior to study entry	Approximately 5 years 2 prior to study entry
Surgery	Curative	Left modified radical mastectomy and axillary lymph node dissection	Approximately 5 years prior to study entry	NA
Cancer therapy	Adjuvant	Tamoxifen	Approximately 5 years prior to study entry	−133

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Breast (left chest wall with bolus) and lymph nodes (left supraclavicular) (dose: each at 5000 cGy, 25 fractions)	Approximately 4 years 11 months prior to study entry	Approximately 4 years 10 months prior to study entry
Radiotherapy	Metastatic	Bone (L2-S3 spine and bilateral SI joints) (dose: 3000 cGy, 15 fractions)	–47	–33

No medical history was reported. Other surgical history included central venous catheterization and bilateral oophorectomy. Concurrent condition included neuropathy peripheral.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Prior to the event of neutrophil count decreased due to which study treatment with paclitaxel was discontinued, the patient was noted with multiple events of neutrophil count decreased and an event of white blood cell count decreased (please refer to table below for details). She received treatment with filgrastim. Relevant laboratory work-up has been reported in the table below.

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
Neutrophil count decreased	2	7	13	Unrelated	Related	None	Cycle 1 Day 15 dose interrupted
Neutrophil count decreased	3	14	20	Unrelated	Related	Drug Interrupted on Study Day 14 and resumed on Study Day 21	Cycle 1 Day 15 dose interrupted
Neutrophil count decreased	2	21	55	Unrelated	Related	None	None

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
Neutrophil count decreased	2	71	76	Related	Related	Drug Interrupted on Study Day 71 and resumed on Study Day 77	Cycle 3 Day 15 dose interrupted
White blood cell count decreased	2	84	142	Unrelated	Related	None	None
Neutrophil count decreased	3	91	97	Related	Related	Drug interrupted from Study Days 91-97 and dose reduced to 300 mg on Study Day 98	Dose delayed and reduced to 65 mg/m^2 on Study Day 98
Neutrophil count decreased	2	112	120	Related	Related	Drug interrupted on Study Day 112 and resumed at a reduced dose of 200 mg (due to the event of Grade 2 diarrhea) on Study Day 121	Cycle 5 Day 1 dose interrupted

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
Neutrophil count decreased	3	136	142	Unrelated	Related	Drug interrupted on Study Day 136 and resumed on Study Day 143	Cycle 5 Day 22 dose interrupted
Neutrophil count decreased	2	171	177	Unrelated	Related	Drug interrupted on Study Day 171 and resumed on Study Day 178	Cycle 7 Day 1 dose interrupted

Event: Neutrophil count decreased

Prior to the event of neutrophil count decreased, the most recent dose of paclitaxel was administered on Study Day 185 and ipatasertib (200 mg) on Study Day 191.

On Study Day 192, the patient was noted with Grade 2 white blood cell count decreased (WBC count 2.39 $\times$ $10^3/\mu L$, non-serious, related to paclitaxel) and non-serious Grade 3 neutrophil count decreased (neutrophils 39%). No treatment was reported for the events. On Study Day 198, the events of neutrophil count decreased, and white blood cell count decreased were considered resolved.

Relevant laboratory work-up:

Study Day	WBC count Normal range: 3.54-9.06 $\times$ $10^3/\mu L$	Neutrophils Normal range: 38.3-71.1%
Screening	3.6	67.2
7	2.41	58.5
14	1.81	45.3
21	2.62	47.7
28	3.79	63.4
35	2.48	59.7
42	2.56	56.7
56	3.43	63.4
71	2.63	44.5
77	4.54	49
84	2.85	54.3
91	2.31	27.7
98	2.98	52.4
105	3.43	54.5

Study Day	WBC count Normal range: 3.54-9.06 × $10^3/\mu L$	Neutrophils Normal range: 38.3-71.1%
112	2.1	52.3
136	2.4	38.7
143	3.82	58.9
171	2.73	44.3
192	2.39	39
199	3.38	56.4

Due to the event of neutrophil count decreased, study treatment with ipatasertib was interrupted on Study Day 192 and next dose was given on Study Day 206; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 185.

The Investigator considered neutrophil count decreased to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 276, a radiographic response assessment showed disease progression with new lesions in lung (left pleura).

On Study Day 315, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 282. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Exemestane and everolimus	315	Ongoing

On Study Day 1129, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Nausea	1	Non-serious	2	Unresolved	Related	Related
Rash	1	Non-serious	2	30	Unrelated	Unrelated

Neuropathy peripheral	3	Non-serious	112	199	Unrelated	Related

Study Number/CRTN:	CO40016/304878	Patient number	2022
Demographics:	57-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T2N3aM0), approximately 2 years and 11 months prior to study entry.

On Study Day −257, the patient was diagnosed with metastatic disease with ER positive, PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lymph node (left axillary and internal mammary). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin, Cyclophosphamide and Docetaxel	Approximately 2 years and 10 months prior to study entry	−880
Surgery	Curative	Right axillary lymph node dissection and partial mastectomy	−855	NA
Cancer therapy	Adjuvant	Tamoxifen	−832	−238
Radiotherapy	Adjuvant	Right chest wall (dose: 5000 cGy, 25 fractions)	−819	−783
Radiotherapy	Adjuvant	Supraclavicular lymph node (dose: 4500 cGy, 25 fractions)	−819	−814
Radiotherapy	Adjuvant	Right chest wall and axillary region (dose: 1500 cGy, 6 fractions)	−779	−771
Cancer therapy	Metastatic	Anastrozole	−237	−20

No medical or other surgical history was reported. Concurrent conditions included joint stiffness, hypertension, and hypothyroidism.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amlodipine and levothyroxine.

Event: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 2.

On Study Day 3, the patient experienced Grade 1 fatigue (non-serious, related), Grade 1 myalgia (non-serious, related to paclitaxel) and was diagnosed with non-serious Grade 1 (initial intensity) peripheral sensory neuropathy (assessment details not reported). She was started on treatment with gabapentin for peripheral sensory neuropathy; no treatment was reported for fatigue and myalgia. On Study Day 19, the event of myalgia resolved.

On Study Day 100, the event of peripheral sensory neuropathy worsened to Grade 2 and further to Grade 3 (most extreme intensity) on Study Day 270. She further received treatment with duloxetine and pregabalin. On Study Day 276, the event of peripheral sensory neuropathy improved to Grade 2. On Study Day 478, the patient developed Grade 1 peripheral motor neuropathy (non-serious, related to paclitaxel). No treatment was reported for this event. On Study Day 503, the event of peripheral sensory neuropathy again worsened to Grade 3.

Due to the event of peripheral sensory neuropathy, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 493.

On Study Day 537, peripheral sensory neuropathy improved to Grade 2 which further improved Grade 1 on Study Day 618. On Study Day 1343, the event of fatigue was considered resolved. The events of peripheral sensory and motor neuropathy remained unresolved at the time of study discontinuation.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 1346, study treatment with ipatasertib was permanently discontinued as per physician decision (tumor evaluation showed complete response) with the last dose of ipatasertib administered on Study Day 1338. The patient entered into long-term follow-up.

On Study Day 1381, the patient was discontinued from the study as per physician's decision (study was terminated by the Sponsor).

Other AEs experienced by the patient during the study:

Cohort	Cohort B		
Event (PT) Category:	Neurotoxicity AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER positive, PR negative and HER2 negative left breast cancer (T1bN0M0) on Study Day −770.

On Study Day −156, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included right liver lobe, multiple lesions in bone and mediastinal lymph nodes. The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left lumpectomy	−741	NA
Surgery	Diagnostic	Left sentinel lymph node biopsy	−741	NA
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide (4 cycles each) and paclitaxel (6 cycles)	−694	−625

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Left breast (dose: 4860 cGy, 18 fractions)	−496	−469
Cancer therapy	Adjuvant	Letrozole	−469	−152
Cancer therapy	Metastatic	Palbociclib and fulvestrant (4 cycles each)	−139	−31

The patient′s medical history included hepatitis C, thyroiditis, and decreased appetite. No other surgical history was reported. Concurrent conditions included chronic gastritis, vitamin D deficiency, back pain, asthenia, and osteoporosis.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included denosumab, paracetamol, calcium and calcifediol.

Event: Neurotoxicity

Prior to the event of neurotoxicity, the most recent dose of paclitaxel was administered on Study Day 35 and ipatasertib (400 mg) on Study Day 41.

On Study Day 42, the patient was diagnosed with non-serious Grade 1 (initial intensity) neurotoxicity (presenting signs and symptoms and diagnostic details not reported). On Study Day 156, the event worsened to Grade 2. No treatment was reported for this event. On Study Day 397, the event of neurotoxicity was considered resolved.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 211.

The Investigator considered neurotoxicity, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 1344, study treatment with ipatasertib and study was permanently discontinued as per physician’s decision (enter post trial access program) with the last dose given on Study Day 1336.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Accidental overdose	1	Non-serious	1	Unresolved	NA	NA
Diarrhea	1	Non-serious	3	68	Related	Related
Headache	1	Non-serious	9	26	Unrelated	Unrelated
Constipation	2	Non-serious	64	Unresolved	Unrelated	Related
Nausea	1	Non-serious	71	112	Related	Related
Pruritus	1	Non-serious	71	112	Related	Related
Asthenia	1	Non-serious	71	112	Related	Related
Alopecia	2	Non-serious	121	252	Unrelated	Related
Back pain	1	Non-serious	142	168	Unrelated	Unrelated
Upper respiratory tract infection	2	Non-serious	183	203	Unrelated	Unrelated
Rhinitis allergic	1	Non-serious	281	336	Unrelated	NA
Pruritus	2	Non-serious	396	Unresolved	Related	Unrelated
Headache	1	Non-serious	861	923	Unrelated	NA

Study Number/CRTN:	CO40016/305631	Patient number	2046
Demographics:	73-year-old female (race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade ≥ 3 Diarrhea		
Event 2 (PT) Categories:	Diarrhea AE leading to study treatment discontinuation, AESI: Grade ≥ 3 Diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal and subtype: not otherwise specified, poorly differentiated, ER/PR positive and HER2 negative metastatic left breast cancer (T3N3M1) on an unknown date.

At screening site of disease involvement included lung (right pleural cavity, subpleural in the basal lateral segment) and mediastinum (subcarinal lesion). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy	Approximately 28 years prior to study entry	NA
Cancer therapy	Metastatic	Fulvestrant	−714	−98
Surgery	Curative	Left radical mastectomy	−49	NA

The patient′s medical history included metastasis in right thigh. Other surgical history included lung lobectomy, caesarean section, tonsillectomy, and hysterectomy. Concurrent conditions included hypertension, dyslipidemia, anemia, and constipation.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included enalapril.

The patient underwent enema for pre-existing constipation. After which, she experienced Grade 2 diarrhea (non-serious, unrelated) from Study Day 4 to Study Day 7. She received loperamide (details reported in the table below).

Event 1: Diarrhea (Grade 3)

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 11.

On Study Day 12, the patient experienced non-serious Grade 3 diarrhea (10 times per day). Reportedly, she had no fever. Coproculture was negative. Treatment with loperamide was maintained (details in table below) and she received additional treatment with ciprofloxacin, *Saccharomyces boulardii*, pargeverine, oral electrolytes, levosulpiride, ranitidine, dimenhydrinate, magnesium sulphate and hydration with sodium chloride and potassium chloride. She was also given unspecified corticosteroids and dietary advice. On Study Day 15, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	5	6
Diarrhea	4	PO	7	7
Diarrhea	6	PO	8	10
Diarrhea	12	PO	11	35

Due to the event of diarrhea, study treatment with ipatasertib was interrupted on Study Day 12 and resumed at a reduced dose of 300 mg on Study Day 19; Cycle 1 Day 15 dose of paclitaxel was delayed by a week and administered at a reduced dose of 65 mg/m^2 on Study Day 23.

The Investigator considered Grade 3 diarrhea to be unrelated to paclitaxel and related to ipatasertib and disease under study.

Event 2: Diarrhea (Grade 3; second episode)

Prior to the event of diarrhea (Grade 3, second episode), the most recent dose of paclitaxel was administered on Study Day 30 and ipatasertib (300 mg) on Study Day 33.

On Study Day 34, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. On Study Day 35, the event of diarrhea worsened to Grade 3. She received treatment with loperamide and hydration with sodium chloride and potassium chloride. On Study Day 36, the patient visited for consultation and physical examination. Diarrhea was reported to be controlled considerably by that time and was considered resolved on the same day (Study Day 36).

Due to the event of diarrhea, study treatment with ipatasertib was permanently discontinued on Study Day 36 with the last dose administered on Study Day 35.

On Study Day 36, study treatment with paclitaxel was permanently discontinued as the patient withdrew consent from the study with the last dose administered on Study Day 30. The patient entered long-term follow-up.

The Investigator considered Grade 3 diarrhea (second episode) to be related to ipatasertib and unrelated to paclitaxel.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel	43	Ongoing

On Study Day 451, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Rash	1	Non-serious	29	Resolving	Unrelated	Unrelated
Rash	1	Non-serious	46	51	Unrelated	Related

Study Number/CRTN:	CO40016/304634	Patient number	2047
Demographics:	53-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Polyneuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with mucinous, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T1cN2aM0) on Study Day −904.

On Study Day −266, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included soft tissue (midline sternum) and skin (right abdominal wall). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left lumpectomy and axillary lymph node dissection	−860	NA
Cancer therapy	Adjuvant	Doxorubicin, and cyclophosphamide	−813	−741
Cancer therapy	Adjuvant	Paclitaxel	−713	−657
Surgery	Curative	Left simple mastectomy	−637	NA
Cancer therapy	Adjuvant	Tamoxifen	−628	−266

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Lymph node (left arm pit) and scar after mastectomy (each at 45 cGy, 20 fractions)	−573	−545
Cancer therapy	Metastatic	Letrozole and ribociclib	−218	−28

No medical or other surgical history was reported. Concurrent conditions included hypertension and anxiety disorder.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included nebivolol.

Event: Polyneuropathy

Prior to the event of polyneuropathy, the most recent dose of paclitaxel was administered on Study Day 127 and ipatasertib (400 mg) on Study Day 132.

On Study Day 133, the patient was diagnosed with non-serious Grade 1 polyneuropathy (signs and symptoms not reported). She was started on treatment with cyanocobalamin/pyridoxine/thiamine. On Study Day 220, the event of polyneuropathy worsened to Grade 3. She further received treatment with pregabalin. On Study Day 249, the event of polyneuropathy improved to Grade 2 and remained unresolved at the time of patient's death.

Due to the event of polyneuropathy; there was no change in study treatment with ipatasertib; however, paclitaxel dose was first reduced to 65 mg/m^2 on Study Day 141 and then permanently discontinued with the last dose administered on Study Day 213.

The Investigator considered polyneuropathy, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 273, a radiographic response assessment showed disease progression with new lesions in skin (midline new nodules).

On Study Day 281, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of administered on Study Day 273 The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Liposomal doxorubicin and cyclophosphamide	284	Ongoing

On Study Day 542, the patient was lost to follow-up. On Study Day 584, she died (as per public records).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/304191	Patient number	2051
Demographics:	68-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with moderately differentiated, ER/PR positive and HER2 negative metastatic left breast cancer (T4bN2M1; histological subtype: not otherwise specified) on Study Day -47.

At screening site of disease involvement included left breast (2 lesions), left axillary lymph node, right pleura and bilateral lung. The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatments were reported.

The patient′s medical history included chronic gastritis, chronic pancreatitis, cholelithiasis, chronic cholecystitis, hiatus hernia, gastroesophageal reflux disease, deafness neurosensory, cardiovascular somatic symptom disorder, intervertebral disc protrusion, seasonal allergy,

autoimmune thyroiditis, goitre, varicose vein, gout and vaginal prolapse. No surgical history was reported. Concurrent conditions included hypertension, breast pain, asthenia, and anxiety.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included enalapril, levothyroxine and loperamide.

On the same day (Study Day 1), the patient started receiving loperamide prophylactically (total daily dose: 2 mg).

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 8.

On Study Day 9, the patient experienced non-serious Grade 1 (initial intensity) diarrhea and Grade 2 asthenia (non-serious, related). On Study Day 43, she was reported with Grade 1 discolored feces (non-serious, related to ipatasertib) and worsening of diarrhea to most extreme Grade 3 intensity. Stool culture was performed (results not provided). She received treatment with loperamide. Grade changes and loperamide treatment details for the event of diarrhea reported in the table below. On Study Day 45, she experienced Grade 1 flatulence (non-serious, related to ipatasertib). On Study Day 127, the event of discolored feces was considered resolved. On Study Day 140, the events of diarrhea and flatulence were considered resolved.

Grade changes for diarrhea:

Study Day	Grade changes for diarrhea
43	3
45	1
72	2
73	1
78	2
79	1

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	2	PO	1	141
Diarrhea	4	PO	43	43
Diarrhea	2	PO	72	78

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	2	PO	163	163
Prophylaxis of diarrhea	2	PO	179	179
Prophylaxis of diarrhea	2	PO	183	183
Diarrhea	2	PO	215	220

Due to the event of diarrhea, ipatasertib dose was reduced to 300 mg on Study Day 86 and paclitaxel dose was reduced to 65 mg/m^2 from Study Day 92.

The Investigator considered diarrhea to be related to paclitaxel and ipatasertib.

The patient developed Grade 1 peripheral sensory neuropathy (non-serious, related to paclitaxel) from Study Day 43 to Study Day 56 for which she did not receive any treatment.

Event 2: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 71 and ipatasertib (400 mg) on Study Day 73.

On Study Day 74, the patient was diagnosed with Grade 1 (initial intensity) peripheral sensory neuropathy (presenting symptoms not reported). Grade changes for the event of peripheral sensory neuropathy are reported in the table below. She received treatment with vitamin B1 in combination with vitamin B6 and/or vitamin B12 and meloxicam.

Grade changes for peripheral sensory neuropathy:

Study Day	Grade changes for peripheral sensory neuropathy
102	3
110	2
268	3
415	2

Due to the event of peripheral sensory neuropathy, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 267.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 397, a radiographic response assessment showed disease progression.

On Study Day 400, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 392. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Exemestane and everolimus	419	Ongoing

On Study Day 898, the events of peripheral sensory neuropathy and asthenia were considered resolved.

On Study Day 1269, the patient was permanently discontinued from the study as per physician's and Sponsor's decision.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304335	Patient number	2064
Demographics:	48-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Category:	Anemia AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Gamma-glutamyl transferase increased Grade $\geq$ 3 hepatotoxicity		
Event 3 (PT) Category:	Leukopenia AE leading to study treatment discontinuation		
Event 4 (PT) Category:	Neutropenia AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was diagnosed with ductal, ER/PR positive and HER 2 negative, locally advanced unresectable, metastatic left breast cancer (T1N0M1; histological grade unknown) on Study Day −377.

At screening, sites of disease involvement included left breast, multiple bone lesions and bilateral pleural nodules. The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Metastatic	Bone: Sacrum (8 cGy, 1 fraction)	−363	−363
Radiotherapy	Metastatic	Bone: D10 (8 cGy, 1 fraction)	−358	−358
Cancer therapy	Metastatic	Ribociclib, letrozole and goserelin	−327	−63

No medical or surgical history was reported. Concurrent conditions included hypertension and headache.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included denosumab and chlorphenamine.

On Study Day 28, the patient was noted to have Grade 1 gamma-glutamyl transferase increased (non-serious, unrelated, GGT value not reported). No treatment was given for this event.

Event 1: Anemia
Event 2: Gamma-glutamyl transferase increased (GGT increased)

Event 3: Leukopenia
Event 4: Neutropenia

Prior to the event of anemia, the most recent dose of ipatasertib (400 mg) was administered on Study Day 21 and paclitaxel on Study Day 29.

On Study Day 35, the patient was diagnosed with non-serious Grade 1 anemia (hemoglobin: 11.6 g/dL). She received treatment with epoetin alfa and lactoferrin for anemia. On the same day (Study Day 35), Grade 1 event of gamma-glutamyl transferase increased was considered resolved.

Prior to the event of gamma-glutamyl transferase increased, the most recent dose of paclitaxel was administered on Study Day 36 and ipatasertib (400 mg) on Study Day 42.

On Study Day 43, the patient was noted with Grade 1 alanine aminotransferase increased (non-serious, unrelated; ALT 59 U/L) and non-serious Grade 2 (initial intensity) gamma-glutamyl transferase increased (GGT value not reported). On Study Day 52, the event of gamma-glutamyl transferase increased worsened to Grade 3. On Study Day 57, the event of alanine aminotransferase increased was considered resolved. No treatment was reported for these events. Relevant laboratory work-up is detailed in the table below.

Prior to the events of leukopenia and neutropenia that led to paclitaxel discontinuation, the patient was noted with multiple non-serious events of leukopenia and neutropenia detailed in the table below. She received GCSF prophylactically on Study Day 174 and Study Day 229. Relevant laboratory work-up is detailed in the table below.

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
Neutropenia	2	14	28	Unrelated	Unrelated	None	Cycle 1 Day 15 interrupted and next dose was given on Study Day 29 (Cycle 2 Day 1)
Leukopenia	2	14	28	Unrelated	Unrelated	None	None
Leukopenia	2	42	52	Related	Related	None	None
Neutropenia	2	43	52	Related	Related	None	None
Neutropenia	1	70	84	Unrelated	Unrelated	Dose reduced to 300 mg from Study Day 85	Cycle 3 Day 15 interrupted and next dose was given on Study Day 85 (Cycle 4 Day 1)
Leukopenia							
Leukopenia	2	98	112	Unrelated	Related	None	Cycle 4 Day 15 interrupted and next dose was given on Study Day 113 (Cycle 5 Day 1)
Neutropenia				Unrelated	Unrelated		
Leukopenia	1	126	147	Unrelated	Unrelated	None	None
Neutropenia	2	126	147	Unrelated	Unrelated	None	None
Leukopenia	2	126	182	Related	Unrelated	None	None
Neutropenia	1	175	182	Related	Related	None	None
Leukopenia	2	203	231	Unrelated	Related	None	None
Neutropenia	1	210	224	Related	Related	None	None

Prior to the event of leukopenia and neutropenia which led to study treatment discontinuation, the most recent dose of paclitaxel was administered on Study Day 260 and ipatasertib (300 mg) was administered on Study Day 265.

On Study Day 266, the patient was noted to have non-serious Grade 2 leukopenia and Grade 1 neutropenia (WBC count and neutrophil count for this day not reported). No treatment was reported for these events. Relevant laboratory work-up is detailed in the table below. On study Day 367, the event of gamma glutamyl transferase increased was considered resolved. On Study Day 394, the events of neutropenia and leukopenia were considered resolved. On Study Day 507, the event of anemia was considered resolved.

311	11.3	4.7	2.4
338	11.4	4.86	2.9
367	11.5	3.26	1.8
394	11.6	3.59	2.2
423	11.4	3.93	2.3

There was no change in study treatment due to the event of gamma-glutamyl transferase increased.

Due to the events of anemia, leukopenia and neutropenia, there was no change in the study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 267.

The investigator considered anemia to be related to paclitaxel, ipatasertib and other causes (unspecified).

The investigator considered gamma-glutamyl transferase increased to be unrelated to paclitaxel and ipatasertib and related to other causes (unspecified).

The investigator considered neutropenia and leucopenia to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 1361, the patient was permanently discontinued from the study as the patient entered post trial access program.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Diarrhea	2	6	24	Related	Unrelated

Study Number/CRTN:	CO40016/304335	Patient number	2072
Demographics:	53-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Paresthesia AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Blood creatine phosphokinase increased SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304792	Patient number	2085
Demographics:	58-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with poorly differentiated, ER/PR positive and HER2 negative, metastatic right breast cancer (T3N0M1; histological subtype not otherwise specified) on Study Day −84.

At screening, sites of disease involvement included lymph nodes (prominent lymph nodes in axillary and intraperitoneal regions), diffuse asymmetry in the upper quadrant of the right breast, lung (rare micronodules distributed by the pulmonary cortex, non-specific) and bone (disseminated bone blast lesions, lytic lesions in frontal bone and in the vertebral body of D4). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Zoledronic acid and anastrozole	−56	−26
Radiotherapy	Metastatic	Lumbar spine (dose unknown, 1 fraction)	−28	−15

No medical or surgical history was reported. Concurrent conditions included hypertension, dyslipidemia, labyrinthitis and arthralgia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amiloride/hydrochlorothiazide, codeine/paracetamol and rosuvastatin.

Event: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 72 and ipatasertib (400 mg) on Study Day 79.

On Study Day 86, the patient was diagnosed with Grade 1 (initial intensity) neuropathy peripheral (signs and symptoms not reported). On Study Day 134, the event of neuropathy peripheral worsened to Grade 2, which further worsened to Grade 3 on Study Day 162. No treatment was reported for the event. The event of neuropathy peripheral remained unresolved at the time of patient′s death.

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 161.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 232, a radiographic response assessment showed disease progression with new lesions in right liver (secondary aspect lesions).

On Study Day 253, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of administered on the same day (Study Day 253). The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Cisplatin and gemcitabine	254	304
Anastrozole	329	366

On Study Day 367, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Asthenia	1	Non-serious	3	Unresolved	Unrelated	Related
Vomiting	1	Non-serious	11	11	Unrelated	Related
Leukopenia	3	Non-serious	15	57	Unrelated	Related
Neutropenia	3	Non-serious	15	16	Unrelated	Related
Alopecia	2	Non-serious	35	Unresolved	Unrelated	Related
Vomiting	1	Non-serious	72	73	Unrelated	Related
Diarrhea	2	Non-serious	77	88	Related	Unrelated
Anemia	1	Non-serious	97	118	Unrelated	Related
Bone pain	2	Non-serious	105	Unresolved	Unrelated	Unrelated
Diarrhea	1	Non-serious	129	219	Related	Related

Study Number/CRTN:	CO40016/304332	Patient number	2098
Demographics:	57-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Rash erythematous AESI: Grade ≥ 3 rash		
Event 2 (PT) Category:	Aspartate aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity		

Event 3 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day 1.

The patient was initially diagnosed with lobular, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T2N0M0), approximately 9 years prior to study entry following right radical mastectomy.

On Study Day -438, the patient was diagnosed with metastatic disease (ER and PR status was unknown and HER2 status was not assessed in metastatic tissue). At screening sites of disease involvement included bone (chest bone, C7, bilateral head of the shoulder bones, body of lumbar vertebra, bilateral pelvis and head of the left femur) and liver (S6 and S8). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Tamoxifen	Approximately 9 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Metastatic	Letrozole	−430	−62

No medical or other surgical history was reported. Concurrent conditions included chronic gastritis and pain.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

Event 1: Rash erythematous (Erythematosus rash on whole body)

Prior to the event of rash erythematous, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 19.

On Study Day 20, the patient experienced Grade 3 rash erythematous on whole body. She received treatment with chloropyramine. On Study Day 37, the event of rash erythematous was considered as resolved.

Due to the event of rash erythematous; there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 28 and resumed on Study Day 38 at a reduced dose of 300 mg.

The Investigator considered rash erythematous to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 129, a laboratory work-up showed Grade 2 aspartate aminotransferase increased (non-serious, related; AST 102 U/L) and Grade 2 alanine aminotransferase increased (non-serious, unrelated; ALT 127 U/L). The patient received treatment with *Cynara cardunculus* extract, arginine citrate/betaine/betaine hydrochloride and phospholipids. On Study Day 148, the events of AST and ALT increased were considered resolved.

Event 2: Aspartate aminotransferase increased (High level of AST)
Event 3: Alanine aminotransferase increased (High level of ALT)

Prior to the events of aspartate aminotransferase increased and alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 178 and ipatasertib (200 mg) on Study Day 184.

On Study Day 185, a laboratory work-up showed non-serious Grade 2 aspartate aminotransferase increased (AST 95 U/L) and Grade 2 alanine aminotransferase increased (ALT 96 U/L). The patient received treatment with *Cynara cardunculus* extract, arginine citrate/betaine/betaine hydrochloride and phospholipids for the events of AST and ALT increased. On Study Day 192, the events of ALT and AST increased worsened to Grade 3. On Study Day 199, the event of ALT increased and AST increased improved to Grade 2. On Study Day 207, the events of AST and ALT increased were considered as resolved.

Due to the events of AST and ALT increased, study treatment with paclitaxel (Cycle 7 Day 1 and Day 8) was interrupted and the next dose was administered on Study Day 207.

Due to the event of AST increased, there was no change in study treatment with ipatasertib; however, due to the event of ALT increased, ipatasertib was permanently discontinued with the last dose administered on Study Day 191.

The Investigator considered AST increased to be unrelated to ipatasertib and related to paclitaxel and concurrent illness.

The Investigator considered ALT increased to be unrelated to paclitaxel and related to ipatasertib and disease under study.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 8-33 U/L	**ALT** Normal range: 4-36 U/L	**Total bilirubin** Normal range: 4.27-20.52 μmol/L	**ALP** Normal range: 42-98 U/L
Screening	104	52	13.2	227.3
129	102	127	13	187.7
135	114	162	14.8	225.9
143	93	127	11.7	301
148	74	66	12.4	268
185	95	96	12.8	195
192	192	196	13	253
199	101	110	11.4	270.9
207	88	73	12	290.4

On Study Day 225, radiographic response assessment showed disease progression.

On Study Day 246, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose administered on Study Day 221. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Doxorubicin	260	401
Eribulin	465	523
Tamoxifen	550	708
Fulvestrant	709	Ongoing

On Study Day 991, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**

Study Number/CRTN:	CO40016/304789	Patient number	2101
Demographics:	73-year-old Black or African American female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Dizziness AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with tubular, well differentiated, ER/PR positive and HER2-negative left breast cancer (T3N2M1) on Study Day −109.

On Study Day −11, the metastatic tissue showed ER positive, PR unknown and HER2-negative disease. At screening, sites of disease involvement included lymph nodes (right upper paratracheal and left axilla), pleura (left superior lobe and left pulmonary base), bone, and lung (left medial lobe), and left breast (junction of internal quadrants). The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatment was reported.

The patient′s medical history included cholecystitis acute. Concurrent conditions included hypertension and anemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amlodipine and furosemide.

Event: Dizziness

Prior to the event of dizziness, the most recent dose of paclitaxel was administered on Study Day 772 and ipatasertib (400 mg) on Study Day 904.

On Study Day 907, the patient experienced non-serious Grade 2 dizziness. No treatment was reported for this event. The event of dizziness remained unresolved at the time of study discontinuation.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 772.

The Investigator considered dizziness, to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 1234, a radiographic response assessment showed disease progression with new lesion in bilateral bone.

On Study Day 1256, the patient was diagnosed with symptomatic deterioration due to bone pain.

On Study Day 1285, study treatment with ipatasertib and study was permanently discontinued due to disease progression with the last dose of ipatasertib administered on Study Day 1162.

Study Number/CRTN:	CO40016/304777	Patient number	2121
Demographics:	71-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative metastatic right breast cancer (T2N2aM1) on Study Day –46.

At screening, sites of disease involvement included bone (bilateral, multiple metastatic lesions), chest (bilateral cardial effusion), lung (bilateral, metastatic lesions), right breast and right axillary lymph node. The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatment was reported.

No medical or surgical history and concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included denosumab.

Event: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 36.

On Study Day 36, the patient was diagnosed with non-serious Grade 2 (initial intensity: Grade 1) peripheral sensory neuropathy (presenting signs and symptoms not reported). Reportedly, the event was considered as local infusion site reaction. No treatment was administered for this event. The event of peripheral sensory neuropathy remained unresolved at the time of patient's death (see narrative below).

Due to the event of peripheral sensory neuropathy, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 119.

The Investigator considered peripheral sensory neuropathy to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 140, study treatment with ipatasertib was permanently discontinued as per physician′s decision (as paclitaxel was discontinued and the ipatasertib was blind treatment it means subject had risk without treatment) with the last dose administered on Study Day 132. The patient entered into long-term follow-up.

On Study Day 336, a radiographic response assessment showed disease progression.

On Study Day 338, a repeat radiographic response assessment showed disease progression with new lesions in brain (bilateral cerebellar hemispheres with leptomeningeal carcinomatosis along the fissure at the superior aspect).

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Cyclophosphamide and epirubicin	140	203
Cyclophosphamide and liposomal doxorubicin	231	322
Radiotherapy to whole brain (total dose: 3000 cGy, 12 fraction)	354	373

On Study Day 505, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ non-serious**	**Onset Day**	**Resolution Day/ Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Mouth ulceration	2	Non-serious	93	Unresolved	Unrelated	Unrelated
Chest discomfort	2	Non-serious	93	Unresolved	Unrelated	Unrelated
Medication error	1	Non-serious	112	132	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305633	Patient number	2122
Demographics:	70-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Categories:	COVID-19 SAE, AE leading to study treatment discontinuation, COVID-19 SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304623	Patient number	2126
Demographics:	72-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T4bN1M0), approximately 5 years prior to study entry.

On Study Day –46, the patient was diagnosed with metastatic disease (PR receptor status unknown, ER and HER2 status was not evaluated in metastatic tissue). At screening, sites of disease involvement included lung (right lung hilus and segment 3 of left lung), multiple lesions in bone and lymph nodes (midline of para-trachealis on mediastinum and liver hilus). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Doxorubicin, cyclophosphamide and paclitaxel	Approximately 5 years prior to study entry	Approximately 5 years prior to study entry
Surgery	Diagnostic	Right axillary lymph node dissection	Approximately 4 years 9 months prior to study entry	NA
Surgery	Curative	Right partial mastectomy and right axillary lymph node dissection	Approximately 4 years 9 months prior to study entry	NA
Cancer therapy	Adjuvant	Tamoxifen	Approximately 4 years 8 months prior to study entry	Approximately 4 years 4 months prior to study entry
Radiotherapy	Adjuvant	Breast (boost) (total dose: 10 cGy; 25 fractions)	Approximately 4 years 4 months prior to study entry	Approximately 4 years 3 months prior to study entry
Radiotherapy	Adjuvant	Breast (total dose: 50 cGy; 25 fractions)	Approximately 4 years 4 months prior to study entry	Approximately 4 years 2 months prior to study entry
Cancer therapy	Adjuvant	Anastrozole	Approximately 4 years 3 months prior to study entry	−54
Cancer therapy	Adjuvant	Anastrozole	−448	−54

The patient's medical history included nephritis. Other surgical history included tooth extraction, cholecystectomy and carpal tunnel decompression. Concurrent conditions included insomnia, neuropathy peripheral, arthralgia, cough, stress urinary incontinence, liver disorder, gastric ulcer, dyspnea exertional and rosacea.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), she received loperamide prophylactically (total daily dose: 2 mg).

Concomitant medications ongoing at Study Day 1 included zolpidem, calcium/cholecalciferol and magnesium lactate/magnesium pidolate/pyridoxine.

The patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib) on Study Day 9 for which she received treatment with loperamide.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	2	PO	1	1
Diarrhea	2	PO	9	10

On Study Day 50, the patient was diagnosed with Grade 1 peripheral neuropathy in the upper extremity (presenting signs and symptoms not reported, non-serious, related to paclitaxel). On Study Day 71, she started treatment with curcumin/lecithin/*Mangifera indica*/*Piper nigrum*/pyridoxine /resveratrol/riboflavin. On Study Day 127, the event of peripheral neuropathy in the upper extremity worsened to Grade 2.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 148 and ipatasertib (400 mg) on Study Day 151.

On Study Day 152, the patient experienced non-serious Grade 3 diarrhea. No diagnostic test was performed. She received treatment with activated charcoal. On the same day (Study Day 152), the event of diarrhea was considered resolved.

There was no change in the study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to paclitaxel and unrelated to ipatasertib.

Event 2: Neuropathy peripheral (Peripheral neuropathy of the lower extremity)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 183 and ipatasertib (400 mg) on Study Day 189.

On Study Day 198, the patient was diagnosed with non-serious Grade 2 neuropathy peripheral of the lower extremity (presenting signs and symptoms not reported). Treatment with curcumin/lecithin/*Mangifera indica/Piper nigrum*/pyridoxine /resveratrol/riboflavin was maintained for neuropathy peripheral. On Study Day 312, the events of neuropathy peripheral in upper and lower extremity were considered as resolved.

Due to the event of neuropathy peripheral (lower extremity), there was no change in the study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 267.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 331, a radiographic response assessment showed disease progression with new lesions in bone (6^{th} rib, TH 4 and manubrium of sternum).

On Study Day 337, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 331. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Fulvestrant	365	Ongoing

On Study Day 1123, the patient was permanently discontinued from the study as LTFU terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Headache	1	Non-serious	1	1	Unrelated	Related
Flatulence	1	Non-serious	1	8	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304880	Patient number	2131
Demographics:	61-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Alanine aminotransferase increased AESI: Grade $\geq$ 3 hepatotoxicity		
Event 2 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, well differentiated, ER/PR positive and HER2 negative, left breast cancer (T4dN3M1) on Study Day −607.

On Study Day -574, the metastatic tissue was ER/PR positive and HER2 receptor equivocal. At screening, sites of disease involvement included bone (multiple metastasis) and left breast. The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Letrozole	−572	−322
Cancer therapy	Metastatic	Tamoxifen	−152	−40

The patient′s medical history included herpes zoster. No surgical history was reported. Concurrent conditions included alanine aminotransferase increased, aspartate aminotransferase increased, hepatic steatosis, lymphedema, left breast injury, breast pain, hypertension, blood cholesterol increased and hyperglycemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included amlodipine, amlodipine/hydrochlorothiazide/olmesartan medoxomil and acetylsalicylic acid.

Event 1: Alanine aminotransferase increased

On Study Day 1, a laboratory work-up revealed ALT 172 U/L (normal range: 5-46 U/L).

Prior to the event of Grade 3 alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 7.

On Study Day 8, a laboratory work-up revealed ALT 233 U/L (normal range: 5-46 U/L) and the patient was reported with worsening of pre-existing condition of alanine aminotransferase increased to Grade 3 (non-serious). The Investigator considered the event as non-clinically significant. No treatment was given for this event. On Study Day 14, the event of Grade 3 ALT increased was considered as resolved (ALT value on Study Day 15 was 196 U/L).

Relevant laboratory work-up:

Study Day	AST Normal range: 13-34 U/L	ALT Normal range: 5-46 U/L	Total bilirubin Normal range: 0.4-1.5 mg/dL	ALP Normal range: 50-155 U/L
Screening	165	100	0.4	105
1	117	172	0.4	115
8	141	233	0.3	96

Study Day	AST Normal range: 13-34 U/L	ALT Normal range: 5-46 U/L	Total bilirubin Normal range: 0.4-1.5 mg/dL	ALP Normal range: 50-155 U/L
15	92	196	0.3	103
29	77	140	0.3	128
35	79	164	0.3	112
44	37	103	0.4	87

There was no change in the study treatment due to this event.

The Investigator considered alanine aminotransferase increased to be unrelated to ipatasertib and paclitaxel and related to concurrent illness.

Event 2: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 29.

On Study Day 30, the patient was diagnosed with Grade 1 neuropathy peripheral (non-serious, presenting signs and symptoms not provided). She was started on treatment with pregabalin; however, on Study Day 85, the event of neuropathy peripheral worsened to Grade 2. On Study Day 128, the event of neuropathy peripheral further worsened to Grade 3. Treatment with pregabalin was maintained and on Study Day 196, the event of neuropathy peripheral improved to Grade 2.

Due to the event neuropathy peripheral, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 120.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 330, radiographic response assessment showed disease progression with new lesion in the liver (segment 5).

On Study Day 338, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 300. The patient entered long-term follow-up.

On Study Day 441, the event of neuropathy peripheral was considered as resolved.

The patient received follow-up anti-cancer therap as listed in table below:

Treatments	Start Day	Stop Day
Exemestane and everolimus	350	427

Radiotherapy to left chest wall, skin and left breast (dose: 5100 cGy, 15 fractions)	393	413
Radiotherapy to right pelvic bone L5 (dose: 2000 cGy, 7 fractions)	457	463
Capecitabine	497	–

On Study Day 882, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Dyspepsia	1	Non-serious	2	60	Unrelated	Related
Constipation	1	Non-serious	3	37	Unrelated	Unrelated
Neutrophil count decreased	3	Non-serious	8	28	Unrelated	Related
Nausea	1	Non-serious	30	350	Unrelated	Related
Diarrhea	1	Non-serious	38	55	Related	Unrelated

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Abdominal pain	1	Non-serious	253	441	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305247	Patient number	2133
Demographics:	72-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Category:	Alanine aminotransferase increased AESI: Grade $\geq$ 3 hepatotoxicity		
Event 2 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T1N0MX), approximately 11 years prior to study entry.

On Study Day −729, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lung (right and left upper lobe, multiple metastatic lesions) and bone (multiple metastatic lesions). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right breast lumpectomy	Approximately 11 years prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, fluorouracil, cyclophosphamide	Approximately 11 years prior to study entry	Approximately 10 years prior to study entry
Radiotherapy	Adjuvant	Breast (loco regional, dose and fractions unknown)	Approximately 10 years prior to study entry	Approximately 10 years prior to study entry
Cancer therapy	Adjuvant	Docetaxel	Approximately 10 years prior to study entry	Approximately 10 years prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 10 years prior to study entry	Approximately 5 years prior to study entry
Radiotherapy	Metastatic	Bone (sacrum; dose: 3000 cGy, 10 fractions)	−719	−702
Cancer therapy	Metastatic	Tamoxifen	−714	−666
Radiotherapy	Metastatic	Bone (sacrum; dose: 3000 cGy, 10 fractions)	−694	−679
Cancer therapy	Metastatic	Fulvestrant	−665	−218
Cancer therapy	Metastatic	Everolimus and exemestane	−218	−23

The patient′s medical history included uterine leiomyoma, scoliosis and tendon injury. Other surgical history included hysterectomy. Concurrent conditions included peripheral sensory neuropathy, anxiety, insomnia, arthralgia, diarrhea, back pain, fatigue, rhinitis allergic, glaucoma, cataract, drug intolerance, drug intolerance and thrombosis.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bimatoprost/timolol, brinzolamide/timolol, paracetamol, denosumab, calcium carbonate/cholecalciferol, lorazepam, carbomer, indomethacin and tinzaparin.

Event 1: Alanine aminotransferase increased

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 5.

On Study Day 6, the patient was noted with non-serious Grade 3 alanine aminotransferase increased (ALT 269 U/L; normal range: 7-33 U/L). No treatment was given for this event. On Study Day 14, the event of ALT increased improved to Grade 2. On Study Day 21, the event of ALT increased further improved to Grade 1. Relevant laboratory values are given in the table below. On Study Day 33, the event of alanine aminotransferase increased was considered resolved.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 8-33 U/L	**ALT** Normal range: 4-36 U/L	**Total Bilirubin** Normal range: 2-21 μmol/L	**ALP** Normal range: 35-104 U/L
Screening	19	44	7.9	79
6	88[a]	269[b]	10.8[c]	160[d]
13	26	108	6.5	114
20	19	76	6.8	104
23	21	64	9	95
26	11	40	9.5	95
33	9	22	7.2	79

[a]normal range: 7-32 U/L, [b]normal range: 7-33 U/L, [c]normal range: 0-15 μmol/L, [d]normal range: 35-105 U/L

Due to this event, study treatment with ipatasertib was interrupted on Study Day 8 and Cycle 1 Day 8 dose of paclitaxel was not administered. The next dose of paclitaxel and ipatasertib (at a reduced dose of 300 mg) was administered on Study Day 21.

The Investigator considered alanine aminotransferase increased, to be related to ipatasertib and paclitaxel.

Event 2: Peripheral sensory neuropathy (peripheral sensitive neuropathy)

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 168 and ipatasertib (300 mg) on Study Day 173.

On Study Day 174, the patient was diagnosed with worsening of her pre-existing condition of peripheral sensory neuropathy to non-serious Grade 3 (presenting signs and symptoms were not reported). On Study Day 183, she experienced Grade 1 pain in extremity (left leg, non-serious, related to paclitaxel). No treatment was given for these events.

Due to the event of peripheral sensory neuropathy, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 168.

On Study Day 297, the event of peripheral sensory neuropathy improved to Grade 2. On Study Day 363, the event of pain in extremity was considered resolved. The event of peripheral sensory neuropathy remained unresolved at the time of patient's death (see narrative below).

The Investigator considered peripheral sensory neuropathy to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 334, a radiographic response assessment showed disease progression with new lesions in liver (multiple).

On Study Day 335, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 328. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatment	Start Day	Stop Day
Capecitabine	347	474
Abemaciclib and fulvestrant	482	566
Eribulin	585	697
Cyclophosphamide	707	806
Radiotherapy to panencephalic brain (dose: 3750 cGy, 15 fractions)	770	790

On Study Day 877, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ non-serious	Onset Day	Resolution Day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Event 5 (PT) Category:	Fatigue AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/305629	Patient number	2139
Demographics:	39-year-old female (race unknown)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Hypertransaminasemia AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with poorly differentiated, ER/PR positive and HER 2 negative left breast cancer (T4cN2aM0; histological subtype: not otherwise specified) on Study Day −253.

On Study Day −58, the patient was diagnosed with locally advanced unresectable disease with ER/PR positive and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included solid lesion in the upper external quadrant of the left breast, left axillary adenopathy and neck (ganglion with a fatty hilum of 1.3×1.1 cm in the right IB group).

No past cancer treatments were reported.

No medical or surgical history and concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing on Study Day 1 were reported.

Event: Hypertransaminasemia

Prior to the event of hypertransaminasemia, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 30 and Study Day 34, respectively.

On Study Day 35, laboratory work-up showed ALT 123 U/L (normal range: 6-40 U/L) and AST 144 U/L (normal range: 9-37 U/L). The patient was diagnosed with non-serious Grade 2 hypertransaminasemia. No treatment was given for this event. On Study Day 150, the event of hypertransaminasemia worsened to Grade 3.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 9-37 U/L	**ALT** Normal range: 6-40 U/L	**Total bilirubin** Normal range: 0.1-1 mg/dL	**ALP** Normal range: 35-104 U/L
Screening	64	67	0.48	47
35	144	123	0.66	59
41	132	155	0.48	65
57	110	95	0.34	67
65	136	123	0.58	61
72	125	121	0.47	58
84	138	92	0.33	58
120	140	126	0.44	66
148	178	163	0.25	69
156	234	166	0.54	68
178	150	123	0.33	68

Due to the event of hypertransaminasemia, study treatment with paclitaxel and ipatasertib was permanently discontinued on Study Day 178 with the last dose of paclitaxel administered on Study Day 136 and ipatasertib on Study Day 142. The patient entered into long-term follow up.

The Investigator considered hypertransaminasemia, to be related to ipatasertib and unrelated to paclitaxel.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Surgery (left breast)	169	NA
Exemestane and leuprorelin	174	Ongoing
Radiotherapy to left breast (total dose: 50 cGy, 25 fractions)	259	291

On Study Day 381, the event of hypertransaminasemia was considered resolved.

On Study Day 1203, the patient was permanently discontinued from the study as the LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/307260	Patient number	2142
Demographics:	74-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Decreased appetite SAE		
Event 3 (PT) Category:	Erythema multiforme SAE		
Event 4 (PT) Category:	Decreased appetite SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304776	Patient number	2145
Demographics:	52-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER positive/PR negative and HER 2 positive right breast cancer (T1N1M0) (histological grade unknown), approximately 13 years prior to study entry followed by modified right radical mastectomy.

On Study Day −913, the patient was diagnosed with metastatic disease with ER/PR positive and HER 2 negative in metastatic tissue. At screening, sites of disease involvement included right lung (mediastinum and subcarinal), small pericardial effusion in mediastinum, chest (small left pleural effusion) and bone (osteolytic focus at the T 11 and distal sternum). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Epirubicin, cyclophosphamide and fluorouracil	Approximately 13 years prior to study entry	Approximately 12 years prior to study entry
Cancer therapy	Adjuvant	Docetaxel	Approximately 12 years prior to study entry	Approximately 12 years prior to study entry
Surgery	Curative	Right partial mastectomy and right lymph node surgery	−882	NA
Cancer therapy	Metastatic	Tamoxifen	−872	−98
Radiotherapy	Metastatic	Right breast chest wall and supraclavicular region (dose: 4400 cGy, 22 fractions)	−827	−798
Cancer therapy	Metastatic	Letrozole and goserelin	−105	−18

The patient's medical history included cholelithiasis and insomnia. Surgical history included central venous catheterization. Concurrent condition included cough.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Neuropathy peripheral (Neuropathy on both hands)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel was administered on Study Day 106 and ipatasertib (400 mg) on Study Day 112.

On Study Day 115, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral of both hands (presenting sign and symptoms not reported). No treatment was given for this event. On Study Day 165, the event of neuropathy peripheral worsened to Grade 2. On Study Day 307, the event of neuropathy peripheral improved to Grade 1. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Due to the event of neuropathy peripheral, study treatment with ipatasertib was interrupted on Study Day 172 and the next dose was administered in Study Day 179; however, study treatment with paclitaxel was permanently discontinued with the last dose administered on Study Day 158.

The Investigator considered neuropathy peripheral, to be unrelated to ipatasertib and related to paclitaxel and disease under study.

On Study Day 392, a radiographic response assessment showed disease progression with new lesions in bilateral lung and liver (multiple bilateral hepatic tumor).

On Study Day 396, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 360. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Vinorelbine and capecitabine	396	545
Bevacizumab, cisplatin and etoposide	568	–
Radiotherapy to whole brain (dose: 3000 cGy, 10 fractions)	606	617

On Study Day 1088, the patient was permanently discontinued from the study as LTFU terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ non-serious	Onset Day	Resolution Day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Nausea	1	Non-serious	32	Unresolved	Unrelated	Related
Constipation	1	Non-serious	37	58	Unrelated	Unrelated
Chest discomfort	1	Non-serious	101	Unresolved	Unrelated	Unrelated
Rash	1	Non-serious	128	Unresolved	Unrelated	Related

Study Number/CRTN:	CO40016/304330	Patient number	2147
Demographics:	77-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Category:	Flushing AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Abdominal discomfort AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Dyspnea AE leading to study treatment discontinuation		

The patient was randomized on Study Day −3.

The patient was initially diagnosed with ER/PR positive left breast cancer (TXN1M0; histological subtype not reported, histological grade unknown and HER2 status not assessed), approximately 30 years prior to study entry, followed by left radical mastectomy.

On Study Day −101, the patient was diagnosed with metastatic disease, with ER positive/ PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included liver (segment II and V) and left supraclavicular lymph node.

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Cyclophosphamide, methotrexate and fluorouracil	Approximately 30 years prior to study entry	Approximately 30 years prior to study entry

No medical history was reported. Other surgical history included hysterosalpingo-oophorectomy. Concurrent conditions included hypercholesterolemia and hypertension.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included ramipril, bisoprolol and rosuvastatin.

Event 1: Flushing (flushing of face and upper chest)
Event 2: Abdominal discomfort
Event 3: Dyspnea (mild dyspnea)

Prior to the events of flushing, abdominal discomfort and dyspnea, the most recent dose of ipatasertib (400 mg) was administered on Study Day 1.

On the same day (Study Day 1), scheduled Cycle 1 Day 1 infusion of paclitaxel was started. Prior to the paclitaxel infusion her vitals showed body temperature 36°C, pulse 70 beats/min, respiratory rate 18 breaths/min and blood pressure 120/80 mmHg. Later, during the paclitaxel infusion, the patient experienced non-serious Grade 2 flushing (face and upper chest), abdominal discomfort and dyspnea. She received treatment with chlorphenamine and hydrocortisone for these events. On the same day (Study Day 1), the events of flushing, abdominal discomfort and dyspnea were considered resolved.

Due to the events of flushing, abdominal discomfort and dyspnea, study treatment with ipatasertib and paclitaxel was permanently discontinued with the last dose administered on Study Day 1. The patient entered into long-term follow-up.

The Investigator considered flushing, abdominal discomfort and dyspnea to be unrelated to ipatasertib and related to paclitaxel.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatment	Start Day	Stop Day
Paclitaxel albumin	11	165

On Study Day 182, radiographic response assessment showed disease progression with new lesions in liver (segment VI and VIII).

The patient further received follow-up anti-cancer therapies with:

Treatments	Start Day	Stop Day
Pegylated liposomal doxorubicin	193	193
Eribulin	195	441
Capecitabine	484	–

On Study Day 1085, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

No other AE were experienced by the patient during the study.

Study Number/CRTN:	CO40016/304880	Patient number	2148
Demographics:	74-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)

Event 4 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		
Event 5 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was diagnosed with tubular, poorly differentiated, ER/PR positive and HER2 negative metastatic right breast cancer (TXNXMX), approximately 4 years 4 months prior to study entry.

At screening, sites of disease involvement included lymph nodes (right adenopathy axillary and left adenopathy), skin (right cutaneous lesion), right breast and bone (right iliac wing). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Cancer therapy	Metastatic	Letrozole and denosumab	Approximately 3 years 7 months prior to study entry	−905
Radiotherapy	Metastatic	Right breast (20 cGy, 5 fractions)	Approximately 2 years 10 months prior to study entry	Approximately 2 years 10 months prior to study entry
Cancer therapy	Metastatic	Fulvestrant and denosumab	−877	−786

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Everolimus and exemestane	−665	−380
Cancer therapy	Metastatic	Palbociclib and fulvestrant	−296	−79

The patient′s medical history included inguinal hernia. Surgical history included hysterectomy. Concurrent conditions included hypertension, dyslipidemia, insomnia, and bone pain.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), she started receiving prophylactic loperamide (total daily dose: 2 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included zopiclone, perindopril, lercanidipine, fluvastatin and atenolol.

Prior to onset of Grade 3 diarrhea (onset: Study Day 61), the patient experienced multiple non-serious events of diarrhea detailed in the table below. Treatment included loperamide (details reported in table below).

Most extreme Grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
2	7	17	Related	Unrelated	Drug interrupted on Study Day 16 resumed on Study Day 29 at a reduced dose of 300 mg	None
1	33	33	Related	Unrelated	None	None
1	40	40	Related	Unrelated	None	None
2	43	45	Related	Related	None	None

Event 1: Neuropathy peripheral (neuropathy)

Prior to the event of peripheral neuropathy, the most recent dose of paclitaxel and ipatasertib (300 mg) was administered on Study Day 43.

On Study Day 44, the patient was diagnosed with Grade 2 (initial intensity) neuropathy peripheral (presenting symptoms not reported). No treatment was reported for this event. On Study Day 64, neuropathy peripheral improved to Grade 1. On Study Day 127, neuropathy peripheral worsened to Grade 2 which further worsened to Grade 3 on Study Day 197. On Study Day 405, the event of neuropathy peripheral was considered resolved.

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 183.

The Investigator considered neuropathy peripheral to be unrelated to ipatasertib and related to paclitaxel.

Event 2: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 57 and ipatasertib (300 mg) on Study Day 60.

On Study Day 61, the patient experienced non-serious Grade 2 diarrhea. On Study Day 62, she started receiving loperamide (total daily dose: 4 mg) and racecadotril. On Study Day 69, the event of diarrhea worsened to Grade 3. Loperamide dose was increased to 8 mg. On Study Day 76, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	2	PO	1	6
Diarrhea	4	PO	7	7
Diarrhea	6	PO	8	8
Diarrhea	8	PO	9	9
Diarrhea	10	PO	10	10
Diarrhea	6	PO	11	11
Diarrhea	2	PO	12	12
Diarrhea	10	PO	13	13
Diarrhea	8	PO	14	16
Diarrhea	4	PO	29	30
Diarrhea	6	PO	31	31
Diarrhea	4	PO	32	32
Diarrhea	4	PO	35	35
Diarrhea	4	PO	40	43
Diarrhea	10	PO	44	44
Diarrhea	4	PO	45	45
Diarrhea	6	PO	46	48
Diarrhea	4	PO	62	67
Diarrhea	6	PO	68	68
Diarrhea	8	PO	69	69
Diarrhea	4	PO	70	70
Diarrhea	4	PO	73	73
Diarrhea	8	PO	74	74
Diarrhea	6	PO	75	75

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

Prior to onset of Grade 3 diarrhea (onset day: Study Day 128), the patient experienced multiple non-serious events of diarrhea detailed in the table below. Treatment included loperamide (details reported in table below).

Most extreme Grade	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**	**Action taken** (Ipatasertib)	**Action taken** (Paclitaxel)
1	91	91	Related	Related	None	None
2	96	118	Related	Unrelated	None	None
1	121	121	Related	Unrelated	None	None

Event 3: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (300 mg) was administered on Study Day 127.

On Study Day 128, the patient experienced non-serious Grade 2 diarrhea. She received treatment with loperamide (details in the table below). On Study Day 143, diarrhea improved to Grade 1. On Study Day 157, the event of diarrhea worsened to Grade 3. Loperamide dose was increased to 12 mg. On Study Day 162, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	**Total daily dose (Units: mg)**	**Route**	**Start day**	**Stop day**
Diarrhea	6	PO	96	97
Diarrhea	6	PO	99	103
Diarrhea	6	PO	105	105
Diarrhea	6	PO	118	118
Diarrhea	8	PO	121	121
Diarrhea	4	PO	127	127
Diarrhea	16	PO	129	129
Diarrhea	8	PO	131	131
Diarrhea	4	PO	132	132
Diarrhea	6	PO	133	134
Diarrhea	6	PO	143	143
Diarrhea	6	PO	146	146
Diarrhea	4	PO	148	148
Diarrhea	4	PO	152	152
Diarrhea	4	PO	155	155
Diarrhea	8	PO	157	159
Diarrhea	12	PO	160	160
Diarrhea	16	PO	161	161

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

Event 4: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (300 mg) was administered on Study Day 183.

On Study Day 184, the patient experienced non-serious Grade 2 diarrhea. She received treatment with loperamide (details in the table below). On Study Day 187, the event of diarrhea worsened to Grade 3. Loperamide dose was increased to 8 mg following which diarrhea improved to Grade 2 on Study Day 188. On Study Day 189, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	172	172
Diarrhea	4	PO	179	179
Diarrhea	4	PO	181	181
Diarrhea	4	PO	183	183
Diarrhea	6	PO	184	184
Diarrhea	4	PO	185	185
Diarrhea	8	PO	187	187
Diarrhea	6	PO	188	189

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 197, the patient experienced Grade 1 dehydration and Grade 2 weight decreased (both non-serious, unrelated). She received dietary supplements for weight decreased; however, no treatment was reported for dehydration.

Event 5: Diarrhea

Prior to the event of diarrhea, the most recent dose of ipatasertib (300 mg) was administered on Study Day 201; study treatment with paclitaxel had already been discontinued.

On Study Day 202, the patient experienced non-serious Grade 3 diarrhea. She received treatment with loperamide (details in the table above). On Study Day 209, the event of diarrhea was considered resolved. On Study Day 229, the event of dehydration was considered resolved. On Study Day 317, the event of weight decreased was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	6	PO	197	202

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	203	203
Diarrhea	6	PO	204	204
Diarrhea	4	PO	205	206

Due to the event of diarrhea, ipatasertib was interrupted on Study Day 202.

On Study Day 217, a radiographic response assessment showed disease progression with new lesions in bone (inter-trochanteric massif), kidney (right ureter) and skin (breast). Subsequently, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 201. The patient entered into long-term follow-up.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Cyclophosphamide and epirubicin	260	524
Capecitabine	587	671
Eribulin	699	790
Cyclophosphamide and epirubicin	804	888
Cyclophosphamide	918	Ongoing

On Study Day 1058, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Hypercalcemia	1	Non-serious	5	83	Unrelated	Unrelated
Hypercalcemia	1	Non-serious	166	314	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304929	Patient number	2157
Demographics:	56-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day −2.

The patient was initially diagnosed with lobular, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (TXNXM1), on Study Day −184.

On Study Day -169, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included bone (cervical, thoracic, lumbar spine, clavicle, sternum, ribs, pelvis and femur) and left breast (from nipple 1 o′clock: 6 cm and 3 o′clock: 4 cm). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Chemotherapy	Metastatic	Letrozole and ribociclib	−173	−21

No medical or surgical history was reported. Concurrent conditions included hypertension, hepatic steatosis, hypercholesterolemia, goiter and pain in extremity (left arm).

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included hydrochlorothiazide/irbesartan and fish oil.

Event: Neuropathy peripheral [Neuropathy (bilateral hands and feet)]

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 57.

On Study Day 58, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral of bilateral hands and feet (presenting signs and symptoms were not reported). No treatment was reported for this event. On Study Day 223, the event of neuropathy peripheral worsened to

Grade 2. On Study Day 309, the event improved to Grade 1. The event of neuropathy peripheral remained unresolved at the time of the study discontinuation.

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 267.

The Investigator considered neuropathy peripheral, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 443, symptomatic deterioration assessment showed increase in non-mass vascularity in the lower central left breast and in the upper quadrant region of uncertain significance with respect to treated malignancy.

On Study Day 477, study treatment with ipatasertib was permanently discontinued due to symptomatic deterioration with the last dose administered on Study Day 469. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Surgery of bilateral breast	482	–
Tamoxifen and denosumab	503	–
Radiotherapy to left chest wall, internal mammary chain, supraclavicular fossa and axilla (dose: 40 cGy, 15 fractions)	524	546

On Study Day 1135, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305245	Patient number	2166
Demographics:	70-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Scleroderma AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T1cN2aM0), approximately 14 years prior to study entry.

On Study Day −7, the patient was diagnosed with metastatic disease with ER/PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included pancreas (pancreatic tail and body) and bone (cranial calvaria, sternum, right scapula, clavicle, bilateral rib cage, lumbar and sacrum cervical dorsum, sacroiliac joint, proximal third of femur and bilateral distal femoral diaphysis).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left lumpectomy	Approximately 13 years prior to study entry	N/A
Chemotherapy	Adjuvant	Didecyldimethyl-ammonium and paclitaxel	Approximately 13 years prior to study entry	Approximately 8 years prior to study entry
Radiotherapy	Adjuvant	Breast (thoracic wall, ganglionar axillo-supraclavicular chain; 5040 cGy, 28 fractions)	Approximately 13 years prior to study entry	Approximately 13 years prior to study entry

No medical or surgical history was reported. Concurrent condition included anxiety, dyslipidemia, hypothyroidism, hypertension, blood alkaline phosphatase increased, amylase increased, and blood triglycerides increased.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included calcium carbonate/cholecalciferol, omeprazole, simvastatin, alprazolam, enalapril, levothyroxine and calcifediol.

Event: Scleroderma (Scleroderma in hands)

Prior to the event of scleroderma, the most recent dose of paclitaxel was administered on Study Day 126 and ipatasertib (400 mg) on Study Day 129.

On Study Day 130, the patient was diagnosed with non-serious Grade 2 scleroderma on hands (presenting signs and symptoms not reported). On Study Day 154, she was noted with Grade 2 edema peripheral on hands (non-serious, related to paclitaxel). No treatment was administered for these events.

On Study Day 168, dose of paclitaxel was reduced to 65 mg/m^2 due to the event of edema peripheral. On Study Day 196, the event of edema peripheral improved to Grade 1. The event of scleroderma remained unresolved and edema peripheral was resolving at the time of patient′s death (see narrative below).

Due to the event of scleroderma, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 244.

The Investigator considered scleroderma to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 651, a radiographic response assessment showed disease progression with new lesions in skin (right cervical lesion).

On Study Day 665, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 643. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Gen 1046	678	780
Cyclophosphamide and doxorubicin	903	903

On Study Day 920, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ non-serious	Onset Day	Resolution Day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Blood triglycerides increased	2	Non-serious	6	Unresolved	Unrelated	Unrelated
Blood glucose increased	1	Non-serious	6	26	Related	Unrelated

Study Number/CRTN:	CO40016/304332	Patient number	2167
Demographics:	66-year-old White female		
Study treatment/ Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Diarrhea AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER positive/PR negative and HER2 negative left breast cancer (T4N1M1) on Study Day −30 following left breast biopsy.

At screening, sites of disease involvement included left breast and lymph nodes (left axillary, left upper clavicular, sub-clavicular, left interpectoral and mediastinal) and bilateral lungs. The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatments were reported.

The patient′s medical history included cerebral ischemia. No surgical history was reported. Concurrent conditions included hypertension, hypertensive cerebrovascular disease, renal cyst, myocardial ischemia, arteriosclerosis coronary artery and hypercholesterolemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day, she also started prophylactic loperamide (total daily dose: 2 mg) for diarrhea.

Concomitant medication ongoing at Study Day 1 included atenolol/chlortalidone/nifedipine.

Prior to onset of the event of diarrhea that led discontinuation of ipatasertib, the patient experienced multiple non-serious events of diarrhea detailed in the table below. Treatment included loperamide (details reported in table below).

Most extreme Grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
2	9	10	Related	Unrelated	None	None
2	12	14	Related	Unrelated	Dose reduced to 300 mg on Study Day 15	None
2	16	23	Related	Unrelated	Dose further reduced to 200 mg on Study Day 29	None
1	41	42	Related	Unrelated	None	None

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 36 and ipatasertib (200 mg) on Study Day 43.

On Study Day 44, the patient experienced non-serious Grade 2 diarrhea. She received treatment with loperamide (details reported in table below). On Study Day 46, diarrhea improved to Grade 1. On Study Day 50, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	2	PO	1	2
Prophylaxis of diarrhea	2	PO	4	4
Prophylaxis of diarrhea	2	PO	7	8
Diarrhea	4	PO	9	10
Prophylaxis of diarrhea	2	PO	11	11
Diarrhea	4	PO	12	14
Prophylaxis of diarrhea	2	PO	15	15
Diarrhea	6	PO	16	16
Diarrhea	12	PO	17	17
Diarrhea	8	PO	18	22
Diarrhea	4	PO	23	23
Prophylaxis of diarrhea	6	PO	24	24
Prophylaxis of diarrhea	2	PO	25	40
Diarrhea	4	PO	41	42
Prophylaxis of diarrhea	2	PO	43	43
Diarrhea	8	PO	44	44
Diarrhea	10	PO	45	45
Diarrhea	4	PO	46	47
Diarrhea	6	PO	48	48
Diarrhea	4	PO	49	49
Diarrhea	2	PO	50	50
Prophylaxis of diarrhea	2	PO	51	56

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, ipatasertib was permanently discontinued with the last dose administered on Study Day 49.

The Investigator considered diarrhea to be unrelated to paclitaxel and related to ipatasertib.

On Study Day 176, a radiographic response assessment showed disease progression with progression of non-target lesions.

On Study Day 191, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose administered on Study Day 170. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Exemestane	191	460
Capecitabine	461	660

On Study Day 679, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/Non-serious	Onset day	Resolution day/Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	1	Non-serious	3	3	Unrelated	Unrelated
Bone pain	2	Non-serious	4	5	Unrelated	Related

Arthritis	2	Non-serious	92	95	NA	Unrelated
Anemia	2	Non-serious	121	142	Unrelated	Related
Neutropenia	3	Non-serious	128	142	Unrelated	Related

Study Number/CRTN:	CO40016/305300	Patient number	2169
Demographics:	72-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Diarrhea AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER2 negative left breast cancer (T2N1M0), approximately 5 years 2 months prior to study entry following left breast lumpectomy and surgery of lymph nodes.

On Study Day −241, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative in metastatic tissue following surgery of lymph nodes. At screening, sites of disease involvement included lung (bilateral including left subpleural anterior segment), liver (segments V, VI and VII) and lymph nodes (bilateral axillary supraclavicular, mediastinal adenopathy. The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Breast (dose unknown)	Approximately 5 years 6 months prior to study entry	Not reported
Cancer therapy	Adjuvant	Docetaxel and cyclophosphamide	Approximately 5 years prior to study entry	Approximately 4 years 8 months prior to study entry
Cancer therapy	Adjuvant	Anastrozole	Approximately 4 years 7 months prior to study entry	−220
Cancer therapy	Metastatic	Palbociclib and fulvestrant	−216	−100
Cancer therapy	Metastatic	Alpelisib and letrozole	−70	−41

The patient′s medical history included nodular vasculitis and pulmonary embolism. Surgical history included varicose vein operation, uterine polypectomy, cholecystectomy and appendicectomy. Concurrent conditions included dyslipidemia, hypertension, varicose vein, neuralgia, contrast media allergy, hepatic pain and pain in extremity (upper left).

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day, she received loperamide (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included zolpidem, rabeprazole, hydrochlorothiazide and pregabalin.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 2.

On Study Day 3, the patient experienced non-serious Grade 2 diarrhea and Grade 2 asthenia (non-serious, unrelated). She received loperamide (total daily dose: 10 mg on Study Day 3-4) for diarrhea. No treatment was given for asthenia. On Study Day 27, the event of asthenia was considered resolved. The patient further received treatment with *Saccharomyces boulardii* and pancreatin for diarrhea. On Study Day 41, the event of diarrhea improved to Grade 1. On Study Day 54, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	Oral	1	1
Diarrhea	6	Oral	2	2
Diarrhea	10	Oral	3	4
Diarrhea	12	Oral	5	5

Due to the event of diarrhea, study treatment with paclitaxel was interrupted at Cycle 1 Day 8 and the next dose was given on Study Day 15; however, ipatasertib was permanently discontinued with the last dose administered on Study Day 3.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 51, a radiographic response assessment showed disease progression. On the same day (Study Day 51), study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose administered on Study Day 42. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Liposomal doxorubicin	86	Ongoing

On Study Day 209, the patient was lost to follow-up.

Other AE experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Neutropenia	1	Non-serious	27	53	Unrelated	Related

Study Number/CRTN:	CO40016/306642	Patient number	2176
Demographics:	44-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Categories:	Rash AE leading to study treatment discontinuation, AESI: Grade $\geq$ 3 rash		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER2 negative left breast cancer (T2N0M0) on Study Day -959.

On Study Day -27, the patient was diagnosed with metastatic disease with ER positive, PR negative and HER2 negative disease in metastatic tissue. At screening sites of disease involvement liver (right side). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neo-adjuvant	Epirubicin, cyclophosphamide and docetaxel	–933	-814
Surgery	Curative	Left breast lumpectomy and left axillary lymph node sampling	-793	NA
Radiotherapy	Adjuvant	Left breast (total dose: 5000 cGy; 25 fractions) and tumor bed (total dose: 1000 cGy; 5 fractions)	-764	-717
Cancer therapy	Adjuvant	Tamoxifen	-708	-66

No medical or other surgical history was reported. Concurrent condition included glucose-6-phosphate dehydrogenase deficiency.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

Prior to the event of Grade 3 rash that led to paclitaxel discontinuation, the patient was noted with multiple events of non-serious rash and pruritus (please refer to table below for details). She received treatment with levocetirizine and betamethasone/fusidic acid. No action was taken with study treatments due to these events.

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Pruritus (hands)	1	9	39	Related	Related
Rash	1	9	39	Unrelated	Related

Event	Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Rash	2	40	51	Unrelated	Related
Pruritus (hands)	2	40	51	Related	Related
Rash	1	51	126	Related	Related
Pruritus (hands)	1	51	62	Unrelated	Related
Pruritus	2	58	61	Related	Related
Pruritus (hands)	1	86	89	Related	Related

Event: Rash

Prior to the event of Grade 3 rash, the most recent dose of paclitaxel and ipatasertib (300 mg) was administered on Study Day 126.

On Study Day 127, the ongoing Grade 1 event of rash worsened to Grade 3. Treatment with levocetirizine and betamethasone /fusidic acid was maintained.

Due to the event of rash, there was no change in treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 126.

On Study Day 132, rash improved to Grade 2. On Study Day 152, rash further improved to Grade 1. On Study Day 197, the event of rash was considered as resolved.

The Investigator considered Grade 3 rash to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 225, radiographic response assessment showed disease progression with new lesion in the liver.

On the same day (Study Day 225), study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 217. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Letrozole and ribociclib	226	311
Capecitabine	325	596
Vinorelbine and carboplatin	604	730
Gemcitabine	765	814
Exemestane and everolimus	828	916

On Study Day 943, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304195	Patient number	2180
Demographics:	57-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		
Additional category:	Death due to disease progression		

A narrative for this patient is available under Section 1.2; Narratives for patients who died due to disease progression.

Study Number/CRTN:	CO40016/304641	Patient number	2181
Demographics:	65-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Polyneuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR positive and HER 2 negative left breast cancer (T2N2M1) on Study Day −95.

On Study Day −47, the patient was diagnosed with metastatic disease with ER/PR positive and HER 2 negative disease in metastatic tissue. At screening, sites of disease involvement included latero-superior region of left breast and midline mediastinum (in front of tracheal bifurcation). The patient was assessed by the Investigator to have visceral crisis.

No past cancer treatments were reported.

No medical history was reported. The patient′s surgical history included tonsillectomy and adnexectomy. Concurrent condition included hypertonia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bisoprolol, hydrochlorothiazide/losartan and losartan.

Event: Polyneuropathy (Polyneuropathia)

Prior to the event of polyneuropathy, the most recent dose of paclitaxel was administered on Study Day 155 and ipatasertib (400 mg) on Study Day 162.

On Study Day 163, the patient was diagnosed with non-serious Grade 2 polyneuropathy (presenting signs and symptoms not reported). No treatment was given for this event. On Study Day 232, the event of polyneuropathy worsened to Grade 3 and remained unresolved at the time of study discontinuation.

Due to the event of polyneuropathy, there was no change in the study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose administered on Study Day 225.

The Investigator considered polyneuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 1177, study treatment with ipatasertib was permanently discontinued as per the physician′s decision (patient to enter post trial access program) with the last dose administered on Study Day 1171.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / non-serious**	**Onset Day**	**Resolution Day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Hyperchlorhydria	2	Non-serious	8	Unresolved	Related	Unrelated
Lipase increased	3	Non-serious	142	281	Unrelated	Unrelated
Diarrhea	2	Non-serious	232	260	Related	Unrelated
Low density lipoprotein increased	1	Non-serious	393	Unresolved	Unrelated	Unrelated
Diarrhea	2	Non-serious	564	575	Related	NA
Diarrhea	1	Non-serious	595	595	Related	NA
Incorrect dose administered	1	Non-serious	607	609	NA	NA
Spinal pain	1	Non-serious	674	Unresolved	Unrelated	NA
Diarrhea	1	Non-serious	730	733	Related	Unrelated

Study Number/CRTN:	CO40016/304627	Patient number	2185
Demographics:	78-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, well differentiated, ER/PR negative, left breast cancer (T1N1aM0; HER2 receptor status was not assessed), approximately 36 years prior to study entry following left modified radical mastectomy.

The patient was diagnosed with metastatic disease, approximately 12 years prior to study entry, with ER/PR positive and HER2 negative in metastatic tissue. At screening, sites of disease involvement included liver (multiple lesions in segment IV, V and VI), bone (multiple) and left pleural effusion. The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Cyclophosphamide, fluorouracil and methotrexate	Approximately 36 years prior to study entry	Approximately 36 years prior to study entry
Cancer therapy	Metastatic	Letrozole	Approximately 12 years prior to study entry	Approximately 7 years prior to study entry
Radiotherapy	Metastatic	Bone (lumbar spine; 2000 cGy, 5 fractions)	Approximately 12 years prior to study entry	Approximately 12 years prior to study entry
Cancer therapy	Metastatic	Tamoxifen	Approximately 7 years prior to study entry	Approximately 2 years 8 months prior to study entry
Cancer therapy	Metastatic	Exemestane	Approximately 2 years 8 months prior to study entry	–524
Cancer therapy	Metastatic	Fulvestrant	–516	–404
Cancer therapy	Metastatic	Everolimus and exemestane	–383	–48

No medical or other surgical history was reported. Concurrent condition included hypertension.

At screening, the patient’s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), she received loperamide prophylactically (total daily dose: 2 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included losartan and cholecalciferol.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 6.

On Study Day 7, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. On Study Day 11, diarrhea worsened to most extreme Grade 3 severity. Grade changes for diarrhea and loperamide treatment details are reported in the table below. On Study Day 80, the event of diarrhea was considered resolved.

Grade changes for diarrhea:

Study Day	Grade changes for diarrhea
8	2
9	1
11	3
17	2
18	1
57	2
58	1
78	2
79	1

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	2	PO	1	1
Diarrhea	4	PO	2	7
Diarrhea	12	PO	8	18
Diarrhea	4	PO	37	44
Diarrhea	4	PO	51	58

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 16 and resumed at a reduced dose of 300 mg on Study Day 30.

The Investigator considered diarrhea to be related ipatasertib and unrelated to paclitaxel.

After the resolution Grade 3 diarrhea, the patient experienced multiple non-serious Grade 2 events of diarrhea detailed in the table below. Treatment included loperamide (details reported in table below).

Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
103	127	Unrelated	Unrelated	None	None
131	155	Related	Unrelated	None	None
157	169	Related	Unrelated	None	None

Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
178	198	Related	Unrelated	None	NA
206	222	Related	Unrelated	None	None
241	241	Related	NA	None	NA
245	246	Related	NA	None	NA
251	252	Related	NA	None	NA
254	254	Related	NA	None	NA

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	8	PO	101	105
Diarrhea	4	PO	131	133
Diarrhea	4	PO	135	141
Diarrhea	4	PO	155	155
Diarrhea	2	PO	159	159

Diarrhea	2	PO	254	254

Event 2: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel and ipatasertib (300 mg) was administered on Study Day 156.

On Study Day 157, the patient was diagnosed with Grade 1 (initial intensity) peripheral sensory neuropathy (presenting symptoms not reported). On Study Day 177, the event of peripheral sensory neuropathy worsened to Grade 2. No treatment was administered for the event. The event of peripheral sensory neuropathy remained unresolved at the time of study discontinuation.

Due to the event of peripheral sensory neuropathy, there was no change in study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 163.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 345, a radiographic response assessment showed disease progression with new lesions in liver (multiple).

On Study Day 352, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 338. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Ribociclib and letrozole	352	801
Capecitabine	806	985
Megestrol	990	–

On Study Day 1009, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/ Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**
Fatigue	1	Non-serious	5	30	Related	Related
Decreased appetite	1	Non-serious	5	72	Related	Unrelated
Nasopharyngitis	1	Non-serious	24	28	Unrelated	Unrelated
Infusion site extravasation	2	Non-serious	30	30	Unrelated	Related
Neutrophil count decreased	3	Non-serious	44	51	Unrelated	Related
Neutrophil count decreased	1	Non-serious	79	93	Unrelated	Related
Vomiting	1	Non-serious	102	102	Unrelated	Unrelated
Bone pain	1	Non-serious	102	102	Unrelated	Unrelated
Decreased appetite	1	Non-serious	150	165	Related	Unrelated
Dysgeusia	1	Non-serious	150	Unresolved	Related	Unrelated
Edema peripheral	1	Non-serious	165	167	Unrelated	Unrelated

Study Number/CRTN:	CO40016/306252	Patient number	2189
Demographics:	49-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER positive/PR negative and HER 2-negative left breast cancer (T3N2M0), approximately 10 years prior to study entry.

On Study Day −180, the patient was diagnosed with metastatic disease with ER positive/PR negative and HER 2-negative disease in metastatic tissue. At screening, sites of disease involvement in left lung, bone (axial and appendicular skeleton) and mediastinum lymph node. The patient was assessed by the investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Cancer therapy	Neo-adjuvant	Epirubicin, cyclophosphamide and docetaxel	Approximately 10 years prior to study entry	Approximately 10 years prior to study entry
Surgery	Curative	Left modified radical mastectomy	Approximately 10 years prior to study entry	NA
Radiotherapy	Adjuvant	Breast (left chest wall; dose: 50 cGy 25 fractions)	Approximately 10 years prior to study entry	Approximately 9 years prior to study entry

No medical or surgical history was reported. Concurrent condition included hypertension.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included telmisartan. She also received prophylactic loperamide (4 mg, PO) for diarrhea on Study Days 1-4.

On Study Day 32, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). On Study Day 40, the event of diarrhea worsened to Grade 2. She received treatment with loperamide (details reported in the table below). On Study Day 54, the event of diarrhea was considered resolved.

Event 1: Diarrhea (Grade 3)

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 94 and ipatasertib (300 mg) on Study Day 98.

On Study Day 99, the patient experienced non-serious Grade 3 acute diarrhea (13 evacuations). On Study Day 100, laboratory work-up showed sodium 139 mEq/L (normal range: 136-145 mEq/L), potassium 4.9 mEq/L (normal range: 3.5-5.1 mEq/L) and creatinine was 3.20 mg/dL (normal range: 0.5-1.2 mg/dL). Reportedly, increased creatinine was considered due to dehydration caused by diarrhea. She was given dietary advice and treatment with loperamide, ciprofloxacin, IV fluids and racecadotril. Later, on the same day (Study Day 100), the event of diarrhea improved to Grade 2. On Study Day 102, the event further improved to Grade 1. On the following day (Study Day 103), the event of diarrhea was considered resolved.

Loperamide details

Indication	Loperamide Dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	32	98
Diarrhea	8	PO	99	100

Relevant laboratory work-up:

Study Day	Creatinine Normal range: 0.5-1.2 mg/dL
Screening	0.74
100	3.2
101	1.47

Due to the event of diarrhea, Cycle 4 Day 15 dose of paclitaxel was interrupted and treatment with ipatasertib was interrupted on Study Day 107. The next dose of paclitaxel (at a reduced dose of 65 mg) and ipatasertib (at a reduced dose of 200 mg) was given on Study Day 114.

The Investigator considered diarrhea, to be related to ipatasertib and paclitaxel.

On Study Day 122, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). No treatment was given for this event. On Study Day 152, the event of diarrhea was considered resolved.

Event 2: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel was administered on Study Day 156 and ipatasertib (200 mg) on Study Day 157.

On Study Day 158, the patient was diagnosed with non-serious Grade 2 peripheral sensory neuropathy (presenting signs and symptoms not reported). No treatment was given for this event. On Study Day 165, the event of peripheral sensory neuropathy was considered resolved.

Due to the event of peripheral sensory neuropathy, there was no change in the study treatment with ipatasertib; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 156.

The Investigator considered peripheral sensory neuropathy to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 622, a radiographic response assessment showed disease progression.

On Study Day 624, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose given on Study Day 614. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Palbociclib and fulvestrant	679	Ongoing

On Study Day 992, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other event experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Constipation	1	Non-serious	2	5	Unrelated	Unrelated
Peripheral sensory neuropathy	2	Non-serious	445	483	Related	NA

Study Number/CRTN:	CO40016/306642	Patient number	2191
Demographics:	57-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, well differentiated, ER positive, PR negative and HER2-negative left breast cancer (T1bN0M0) approximately 4 years and 9 months prior to study entry.

On Study Day −26, the patient was diagnosed with metastatic disease with ER positive, PR negative and HER2-negative disease in metastatic tissue. At screening, sites of disease involvement included liver. The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy	Approximately 4 years and 9 months prior to study entry	NA
Cancer therapy	Adjuvant	Letrozole	Approximately 4 years and 8 months prior to study entry	−607
Cancer therapy	Neo-adjuvant	Cyclophosphamide, docetaxel, and epirubicin (4 cycles each)	−595	−448
Surgery	Curative	Right axillary lymph node dissection	−406	NA
Radiotherapy	Adjuvant	Axillary and supraclavicular lymph nodes (dose: 50 cGy, 25 fractions)	−364	−330
Cancer therapy	Adjuvant	Tamoxifen	−328	−26

The patient's medical history included hyperlipidemia. No surgical history was reported. Concurrent condition included multiple sclerosis.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel and ipatasertib was administered (400 mg) on Study Day 169.

On Study Day 170, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral (presenting signs and symptoms not reported). On Study Day 232, the event of neuropathy peripheral worsened to Grade 3. No treatment was reported for this event. On Study Day 288, the event of neuropathy peripheral improved to Grade 2. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 232.

The Investigator considered neuropathy peripheral, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 394, a radiographic response assessment showed disease progression with new lesion in liver.

On Study Day 395, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of ipatasertib administered on Study Day 395. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Fulvestrant and palbociclib	421	499
Capecitabine	515	Ongoing

On Study Day 987, the patient was discontinued from the study as long term follow-up was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/306642	Patient number	2192

Demographics:	53-year-old White female
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort:	Cohort B
Event (PT) Categories:	Febrile neutropenia SAE, AE leading to study treatment discontinuation
Additional category:	Death due to disease progression

A narrative for this patient is available under Section 1.2; Narratives for patients who died due to disease progression.

Study Number/CRTN:	CO40016/305252	Patient number	2195
Demographics:	68-year-old female (race unknown)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Neutropenia AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with tubular ER/PR positive, and HER2-negative metastatic left breast cancer (histopathology unknown) (TXNXM1) approximately 5 years and 9 months prior to study entry.

At screening, sites of disease involvement included bone and liver. The patient was assessed by the Investigator to have endocrine resistant.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Letrozole and denosumab	Approximately 5 years and 8 months prior to study entry	Approximately 3 years and 10 months prior to study entry
Cancer therapy	Metastatic	Abemaciclib and fulvestrant (32 cycles each)	Approximately 3 years and 9 months prior to study entry	–546
Cancer therapy	Metastatic	Everolimus and exemestane (16 cycles each)	–511	–98

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension and hypercholesterolemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included heparin, bisoprolol/hydrochlorothiazide, nifedipine, urapidil, and *Ginkgo biloba*/heptaminol/troxerutin.

Event: Neutropenia

Prior to the event of neutropenia, the most recent dose of paclitaxel was administered on Study Day 323 and ipatasertib (400 mg) on Study Day 329.

On Study Day 335, a laboratory work-up showed WBC count 3.5×10^9/L (normal range: $3.8\text{-}9.8 \times 10^9$/L) and neutrophil count 1.48×10^9/L (normal range: $1.7\text{-}5.8 \times 10^9$/L). The patient was diagnosed with non-serious Grade 2 neutropenia. No treatment was given for the event. On Study Day 363, the event of neutropenia was considered resolved.

Due to this event, there was no change in study treatment with ipatasertib; however, study treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 323.

Relevant lab values are listed in the table below:

Study Day	WBC count (normal range: $3.8\text{-}9.8 \times 10^9$/L)	Neutrophil count (normal range: $1.7\text{-}5.8 \times 10^9$/L
Screening	6.2	3.99
335	3.5	1.48
363	4.6	2.55

The Investigator considered neutropenia, to be unrelated to ipatasertib and related to paclitaxel.

On Study Day 393, a radiographic response assessment showed disease progression with new lesion in liver and lung (infra-centric lymph node).

On Study Day 407, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose of ipatasertib administered on Study Day 385. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Epirubicin and cyclophosphamide	407	Ongoing

On Study Day 494, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/318262	Patient number	2198
Demographics:	44-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Neutrophil count decreased AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR positive and HER2 negative right breast cancer (T2N1miMX; histological grade unknown), approximately 4 years 11 months prior to study entry.

On Study Day -977, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included liver and bone (sternum). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right partial mastectomy	Approximately 4 years 11 months prior to study entry	NA
Cancer therapy	Adjuvant	Cyclophosphamide and doxorubicin	Approximately 4 years 10 months prior to study entry	Approximately 4 years 9 months prior to study entry
Cancer therapy	Adjuvant	Tamoxifen and goserelin	Approximately 4 years 3 months prior to study entry	–973
Cancer therapy	Metastatic	Palbociclib, exemestane and leuprorelin	–949	–312

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Metastatic	Breast (rib cage and chest wall) (total dose: 4500 cGy; 14 fractions)	−301	−277
Cancer therapy	Metastatic	Palbociclib and letrozole	−245	−166
Cancer therapy	Metastatic	Alpelisib and fulvestrant	−140	−29

No medical and other surgical history was reported. Concurrent conditions included insomnia, arthralgia (shoulder), musculoskeletal chest pain (ribs).

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 doxepin.

Prior to the event of neutrophil count decreased that led to paclitaxel discontinuation, the patient was noted with multiple non-serious events of neutrophil count decreased (please refer to table below for details). She received treatment with filgrastim for Grade 3 events of neutrophil count decreased, however, no treatment was reported for Grade 2 neutrophil count decreased.

Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
3	8	11	Unrelated	Related	Drug interrupted from Study Day 8 to Study Day 10	None
3	18	22	Unrelated	Related	Drug interrupted from Study Day 18 to Study Day 21 and resumed on Study Day 22 at reduced dose of 300 mg	Cycle 1 Day 15 dose delayed and administered Study Day 22 at reduced dose of 65 mg/m^2
2	29	32	Unrelated	Related	None	Cycle 2 Day 1 given on

Most extreme grade	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Action taken (Ipatasertib)	Action taken (Paclitaxel)
						Study Day 33 at reduced dose of 65 mg/m^2

Event: Neutrophil count decreased

Prior to the event of neutrophil count decreased, the most recent dose of paclitaxel was administered on Study Day 40 and ipatasertib (300 mg) on Study Day 45.

On Study Day 46, a laboratory work-up showed WBC count 2.08 x 10^9/L (normal range: 3.15-8.63 x 10^9/L) and neutrophils 27.9% (normal range: 40.6-73.5%; 0.58 x 10^9/L). The patient was noted with non-serious Grade 3 neutrophil count decreased. No treatment was reported for the event. On Study Day 50, the event of neutrophil count decreased was considered resolved.

Relevant laboratory work-up:

Study Day	WBC count Normal range: 3.15-8.63 $\times$ 10^9/L	Neutrophils Normal range: 40.6-73.5%
Screening	7.97	76.3
8	2.07	29.5
11	11.58	80.4
18	2.27	38.4
22	7.59	80.2
29	2.46	41.5
32	3.77	43.7
40	16.47	82.4
46	2.08	27.9
50	5.27	66.6
57	3.7	61.3
68	4.79	85.4

Due to the event of neutrophil count decreased, study treatment with ipatasertib was interrupted on Study Day 46 and resumed on Study Day 50 at a reduced dose of 200 mg, however, paclitaxel was permanently discontinued with the last dose administered on Study Day 40.

The Investigator considered neutrophil count decreased to be related to paclitaxel and ipatasertib.

On Study Day 64, the patient was noted to have Grade 2 neutrophil count decreased (non-serious, related to ipatasertib). On Study Day 68, the event of neutrophil count decreased was considered as resolved without any treatment.

On Study Day 85, a radiographic response assessment showed disease progression.

On Study Day 92, study treatment with ipatasertib was permanently discontinued due to disease progression with the last dose administered on Study Day 77. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel and carboplatin	92	Ongoing
Radiotherapy to bone (L1-L3) (total dose: 2000 cGy; 5 fractions)	277	283

On Study Day 435, the patient was lost to follow-up.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Fatigue	1	Non-serious	2	126	Unrelated	Related

Study Number/CRTN:	CO40016/305649	Patient number	2208
Demographics:	58-year-old female (race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Pleural effusion SAE		
Event 2 (PT) Category:	Lower respiratory tract infection SAE		
Event 3 (PT) Categories:	Pneumonia Death due to AE, SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

1.5 NARRATIVES FOR PATIENTS WHO BECAME PREGNANT WHILE IN THE STUDY

No patient became pregnant while in the study.

1.6 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE ≥ 3 HYPERGLYCEMIA

Study Number/CRTN:	CO40016/305629	Patient number	2008
Demographics:	76-year-old American Indian or Alaska native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Categories:	Diarrhea SAE, AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Categories:	Hyperglycemia SAE, AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hyperglycemia		
Event 3 (PT) Category:	Dehydration SAE		
Event 4 (PT) Category:	Hypoglycemia SAE		
Event 5 (PT) Categories:	Respiratory distress Death due to AE, SAE		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/305386	Patient number	2032
Demographics:	51-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Hyperglycemia AESI: Grade ≥ 3 hyperglycemia		
Event 2 (PT) Categories:	Hyperglycemia AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hyperglycemia		
Event 3 (PT) Category:	Deep vein thrombosis SAE		

Event 4 (PT) Category:	Extravasation SAE

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/307257	Patient number	2079
Demographics:	62-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Hyperglycemia AESI: Grade $\geq$ 3 hyperglycemia		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER positive, PR negative and HER2 negative right breast cancer (T2N2aM0), approximately 6 years prior to study entry.

On Study Day -55, the patient was diagnosed with metastatic disease (ER and PR status was unknown and HER2 status was not assessed in metastatic tissue). At screening sites of disease involvement included liver (S8) and bone (left shoulder blade). The patient was assessed by the Investigator to have visceral crisis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right partial mastectomy and right axillary lymph node dissection	Approximately 6 years prior to study entry	NA
Cancer therapy	Adjuvant	Docetaxel and cyclophosphamide	Approximately 5 years prior to study entry	Approximately 5 years and 4 months prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 5 years and 3 months prior to study entry	–42

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Right breast (dose: 60 cGy; 30 fractions) and right supraclavicular lymph nodes (dose: 50 cGy; 25 fractions)	Approximately 5 years and 2 months prior to study entry	Approximately 5 years and 1 month prior to study entry

The patient's medical history included atrial septal defect. No other surgical history and concurrent condition was reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medication ongoing at Study Day 1 was reported.

On Study Day 60, a laboratory work-up revealed Grade 2 glycosylated hemoglobin increased (HbA1c 7.4%; normal range: 4.6-6.2%; non-serious, related). No treatment was reported for this event; however, Cycle 3 Day 1 dose of paclitaxel was interrupted and ipatasertib was interrupted from Study Day 60. The next dose of ipatasertib and paclitaxel (Cycle 3 Day 8) was given on Study Day 67.

Event: Hyperglycemia (Postprandial hyperglycemia)

Prior to the event of hyperglycemia, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 67.

On the same day (Study Day 67), within 24 hours after the end of paclitaxel infusion, a laboratory work-up showed non-serious Grade 3 postprandial hyperglycemia (glucose level not provided for this date). The patient received treatment with metformin, teneligliptin, miglitol and repaglinide (for treatment details please refer to table below). Relevant laboratory work-up has been reported in the table below. On Study Day 141, the event of glycosylated hemoglobin increased was considered as resolved; however, the event of hyperglycemia improved to Grade 1 and on Study Day 624, the event of hyperglycemia was considered resolved.

Hyperglycemia treatment details:

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Metformin	Postprandial hyperglycemia	250	PO	BID	92	95
Teneligliptin	Postprandial hyperglycemia	20	PO	QD	106	128
Miglitol	Postprandial hyperglycemia	50	PO	QD	120	128

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Repaglinide	Postprandial hyperglycemia	0.5	PO	PRN	151	331
Teneligliptin	Postprandial hyperglycemia	20	PO	PRN	158	173

Relevant laboratory work-up:

Study Day	Glucose (fasting) Normal range: 70-110 mg/dL	HbA1c Normal range: 4.6-6.2%
Screening	105	6.2
60	101	7.4
74	104	—
85	99	—
99	97	—
106	96	—
113	94	—
141	100	6.1
172	99	—
197	94	—
225	106	6.3
253	100	—
281	108	—
309	103*	6.5
344	105*	6.7

*Normal range: 70-109 mg/dL

Due to the event of hyperglycemia, there was no change in study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 74 and resumed at a reduced dose of 300 mg on Study Day 92.

The Investigator considered hyperglycemia to be related to ipatasertib, paclitaxel and concomitant medication.

On Study Day 330, a radiographic response assessment showed disease progression.

On Study Day 336, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 330 and Study Day 336, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Eribulin mesylate	344	526
Capecitabine	541	729
Anastrozole (3 cycles) and abemaciclib (2 cycles)	737	792
Bevacizumab and paclitaxel (7 cycles each)	799	981
Vinorelbine (3 cycles)	995	1037
Epirubicin and cyclophosphamide (3 cycles each)	1051	1093
Everolimus and exemestane (3 cycles each)	1114	1176
Gimeracil/oteracil potassium/tegafur	1177	Ongoing

On Study Day 1219, the patient was permanently discontinued from the study as per the physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Event 3 (PT) Category:	Dehydration SAE		
Event 4 (PT) Category:	Hypoglycemia SAE		
Event 5 (PT) Categories:	Respiratory distress Death due to AE, SAE		

A narrative for this patient is available under Section 1.1; Narratives for patients who died due to adverse event(s).

Study Number/CRTN:	CO40016/304203	Patient number	2028
Demographics:	52-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 day cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 day cycle)		
Cohort	Cohort B		
Event (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		

The patient was randomized on Study Day -3.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative left breast cancer (T2N0M0), approximately 4 years 10 months prior to study entry.

On Study Day -825, the patient was diagnosed with metastatic disease with ER positive, PR negative and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included liver (right hepatic lobe and adjacent to gall bladder fossa) and bone (multiple locations: sacrum, lumbar spine, lower thoracic spine, bilateral clavicles). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left radical mastectomy	Approximately 4 years 10 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, Cyclophosphamide, and tamoxifen	Approximately 4 years 6 months prior to study entry	Approximately 4 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 4 years prior to study entry	-836
Chemotherapy	Adjuvant	Paclitaxel	Approximately 4 years prior to study entry	Approximately 4 years prior to study entry
Cancer therapy	Metastatic	Letrozole and palbociclib	-805	-258
Radiotherapy	Metastatic	Bone (T11-L1) (dose: 3000 cGy, 10 fractions)	-693	-682

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Fulvestrant and palbociclib	-227	-31

No medical history was reported. Other surgical history included thyroidectomy, hysterectomy, appendicectomy and cholecystectomy. Concurrent conditions included hypothyroidism, edema peripheral (bilateral legs), dyspepsia, arthralgia, anxiety, depression, contusion, hot flush, insomnia, bone pain, constipation, abdominal distension, headache, dyspnea, myalgia, rash, anemia, hyperglycemia, aspartate aminotransferase increased, paresthesia (left breast), hypertriglyceridemia, disturbance in attention, neuropathy peripheral and fatigue.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included diclofenac, clonazepam, venlafaxine, eszopiclone, furosemide, calcium carbonate, levothyroxine, omeprazole, senna and docusate.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 4.

On Study Day 5, the patient experienced non-serious Grade 1 diarrhea. She received treatment with loperamide (details reported in table below). On Study Day 46, diarrhea worsened to Grade 3. She experienced >10 episodes of diarrhea per day until Study Day 57. It was reported that during this time she continued to take 2-4 mg loperamide daily, despite instructions to increase the dose of loperamide. She also received dietary and hydration advice. On the same day (Study Day 57), diarrhea was reported to have improved to Grade 1. On Study Day 58, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	2	PO	1	1
Diarrhea	2	PO	19	19
Diarrhea	12	PO	41	41
Diarrhea	2	PO	45	46
Diarrhea	8	PO	47	51
Diarrhea	2	PO	52	53
Diarrhea	4	PO	54	55

Due to the event of diarrhea, study treatment with ipatasertib was interrupted on Study Day 59 and Cycle 3 Day 1 dose of paclitaxel was not administered. The next dose of ipatasertib at a reduced dose of 300 mg and paclitaxel was given on Study Day 65.

The Investigator considered diarrhea, to be related to ipatasertib and paclitaxel.

On Study Day 164, radiographic response assessment showed disease progression.

On Study Day 171, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 150 and ipatasertib on Study Day 163. The patient entered into long-term follow-up phase.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	185	590
Eribulin, trastuzumab and pertuzumab	614	1090
Trastuzumab	1111	Ongoing

On Study Day 1314, the patient was discontinued from the study as per physician's decision (study was terminated by the Sponsor).

Cohort:	Cohort B		
Event (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with lobular, well differentiated, ER/PR positive and HER2 negative right breast cancer (T3N2aM0), approximately 7 years prior to study entry.

On Study Day –905, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening sites of disease involvement included liver (L1 and left lobe subcapsular), bone (multiple) and right ovary. The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Surgery	Curative	Right modified radical mastectomy	Approximately 7 years prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide and paclitaxel	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 7 years prior to study entry	Approximately 2 years 5 months prior to study entry

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Adjuvant	Right chest wall, sub-clavicular area, supraclavicular area, right axilla (50 cGy, 25 fractions)	Approximately 6 years prior to study entry	Approximately 6 years prior to study entry
Cancer therapy	Metastatic	Fulvestrant	−842	−794
Cancer therapy	Metastatic	Letrozole	−758	−300
Cancer therapy	Metastatic	Exemestane and Everolimus	−299	−40

The patient′s medical history included humerus fracture. Other surgical history included hysterectomy, bilateral salpingo-oophorectomy and appendicectomy. Concurrent conditions included liver disorder and anemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), she also received loperamide (total daily dose: 4 mg) prophylactically for diarrhea.

Concomitant medications ongoing at Study Day 1 included calcium/cholecalciferol and denosumab.

The patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib) from Study Day 51 to Study Day 52 and Grade 2 proctalgia (non-serious, unrelated) from Study Day 51 to Study Day 53. She received treatment with diosmectite and loperamide (total daily dose: 4 mg) for diarrhea and *Quercus spp*. bark extract for proctalgia.

On Study Day 61, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (total daily dose: 2 mg) and diarrhea was considered resolved. On Study Day 64, dose of loperamide increased to 4 mg.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 66.

On Study Day 67, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. On Study Day 70, dose of loperamide was further increased to 6 mg and she also received diosmectite for diarrhea. On Study Day 79, the event of diarrhea worsened to Grade 3.

Loperamide dose was increased to 8 mg (details reported in table below). On the same day (Study Day 79), the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Prophylaxis of diarrhea	4	PO	1	1
Diarrhea	2	PO	2	6
Diarrhea	4	PO	7	21
Diarrhea	4	PO	30	36

Diarrhea	4	PO	104	106
Diarrhea	2	PO	115	115
Diarrhea	2	PO	124	128
Diarrhea	2	PO	158	158

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, ipatasertib dose was reduced to 300 mg on Study Day 86.

The Investigator considered diarrhea to be unrelated to paclitaxel and related to ipatasertib.

Study treatment with paclitaxel first interrupted and then permanently discontinued as per patient′s wish. The last dose of paclitaxel was administered on Study Day 212.

On Study Day 274, a radiographic response assessment showed disease progression.

On Study Day 289, study treatment with ipatasertib was permanently discontinued due to disease progression. The patient received the last dose of ipatasertib on Study Day 288. She entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Investigational drug (SAR439859)	316	372
Radiotherapy to brain (30 cGy, 10 fractions)	462	476

On Study Day 472, the patient withdrew consent from study.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304335	Patient number	2092
Demographics:	37-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Abdominal pain SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/307256	Patient number	2102
Demographics:	39-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		
Additional category:	Death due to disease progression		

A narrative for this patient is available under Section 1.2; Narratives for patients who died due to disease progression.

Study Number/CRTN:	CO40016/305252	Patient number	2116
Demographics:	78-year-old female (Race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		
Event 2 (PT) Categories:	Diarrhea SAE, AESI: Grade ≥ 3 diarrhea		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/304622	Patient number	2118
Demographics:	65-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Diarrhea AESI: Grade $\geq$ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive, and HER2 negative right breast cancer (T2N1M0), approximately 7 years prior to study entry following right partial mastectomy.

On Study Day -327, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included chest wall, lung (bilateral lower lobe and parenchyma), lymph node (hilum of the right lung, retroperitoneum, and mediastinum: right paratracheal), soft tissue (4th right rib) and bone (right humerus). The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Cyclophosphamide and doxorubicin	Approximately 7 years prior to study entry	Approximately 6 years prior to study entry
Cancer therapy	Adjuvant	Paclitaxel	Approximately 6 years prior to study entry	Approximately 6 years prior to study entry
Cancer therapy	Adjuvant	Letrozole	Approximately 6 years prior to study entry	−460
Radiotherapy	Adjuvant	Right breast and lymph nodes (5000 cGy; 25 fractions)	Approximately 6 years prior to study entry	Approximately 6 years prior to study entry
Cancer therapy	Metastatic	Fulvestrant	Approximately 9 months prior to study entry	−54
Surgery	Curative	Right breast axillary dissection	−241	NA

No medical history was reported. Other surgical history included arthroscopy and hysterectomy. Concurrent conditions included hypertension, osteoporosis, neuropathy peripheral, pain in extremity, and edema peripheral.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. On the same day (Study Day 1), she started receiving loperamide (total daily dose: 4 mg) for diarrhea.

Concomitant medications ongoing at Study Day 1 included calcium carbonate/cholecalciferol, cholecalciferol, nebivolol, gabapentin, paracetamol/tramadol, ibuprofen, *Aesculus hippocastanum* extract, zoledronic acid, and omeprazole.

On Study Day 10, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). On Study Day 13, diarrhea worsened to Grade 2 and loperamide dose was increased to 12 mg (for detailed dosing please refer to table below). She also received treatment with atropine sulfate/diphenoxylate and codeine. On Study Day 16, diarrhea improved to Grade 1. On Study Day 24, the event of diarrhea was considered resolved. On Study Day 26, loperamide was stopped.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 36.

On Study Day 37, the patient experienced non-serious Grade 2 (initial intensity) diarrhea. Treatment with atropine sulfate/diphenoxylate and codeine was maintained. On Study Day 38, diarrhea improved to Grade 1. On Study Day 128, the event of diarrhea worsened to Grade 3 (most extreme intensity). Grade changes details during the course of the event are reported in the table below. On Study Day 148, she was again started on loperamide (for detailed dosing please refer to table below). On Study Day 445, the event of diarrhea was considered resolved.

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 436, a radiographic response assessment showed disease progression with new lesions in brain (bilateral choroid plexus, right occipital and left parietal).

On Study Day 464, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 421 and ipatasertib on Study Day 436. The patient entered into the long-term follow-up.

On Study Day 480, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Demographics:	55-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Diarrhea AESI: Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative right breast cancer (T1cN0M0), approximately 9 years prior to study entry following right lumpectomy.

On Study Day −763, the patient was diagnosed with metastatic disease (ER and PR status were unknown and HER2 status was not assessed) in metastatic tissue. At screening, site of disease

involvement included lung (segment 7), liver (whole liver) and bone (right acetabulum of the hip joint). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Docetaxel and Cyclophosphamide	Approximately 8 years prior to study entry	Approximately 8 years prior to study entry
Cancer therapy	Adjuvant	Tamoxifen	Approximately 8 years prior to study entry	Approximately 2 years prior to study entry
Radiotherapy	Adjuvant	Right breast (total dose: 4250 cGy; 17 fractions)	Approximately 8 years prior to study entry	Approximately 8 years prior to study entry
Radiotherapy	Adjuvant	Boost (total dose: 1000 cGy; 4 fractions)	Approximately 8 years prior to study entry	Approximately 8 years prior to study entry
Radiotherapy	Metastatic	Bone (right hip) (total dose: 3000 cGy; 10 fractions)	−752	−742
Cancer therapy	Metastatic	Fulvestrant	−744	−625
Cancer therapy	Metastatic	Letrozole	−597	−506
Radiotherapy	Metastatic	Bone (C6 and TH5) (total dose: 2000 cGy; 5 fractions)	−511	−506
Cancer therapy	Metastatic	Radium 223 dichloride	−484	−343
Cancer therapy	Metastatic	Exemestane and Everolimus	−484	−91
Radiotherapy	Metastatic	Liver (total dose: 50 cGy; 10 fractions)	−57	−49

No medical or other surgical history was reported. Concurrent conditions included bone pain and asthenia.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel. She received loperamide prophylactically from Study Day 1 to Study Day 28 (total daily dose: 4 mg).

Concomitant medications ongoing at Study Day 1 included zoledronic acid and nimesulide.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 36 and ipatasertib (400 mg) on Study Day 38.

On Study Day 39, the patient experienced non-serious Grade 2 diarrhea. She received treatment with loperamide (8 mg). The following day (Study Day 40), diarrhea worsened to Grade 3. Reportedly, dietary etiologies and infections were ruled out (details not provided). She received treatment with loperamide (16 mg), diosmectite and intravenous hydration with glucose and unspecified electrolytes. She was also given dietary advice. On Study Day 41, diarrhea improved to Grade 2. On Study Day 44, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea prophylaxis	4	PO	1	28
Diarrhea	8	PO	39	39
Diarrhea	16	PO	40	40
Diarrhea	10	PO	41	41
Diarrhea	8	PO	42	43
Diarrhea	4	PO	44	44

Due to the event of diarrhea, there was no change in study treatment with paclitaxel; however, study treatment with ipatasertib was interrupted on Study Day 42 and thereafter permanently discontinued due to disease progression (see narrative below).

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 54, a radiographic response assessment showed disease progression with new lesions in bone (right acetabulum of the hip joint).

On Study Day 57, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 36 and ipatasertib on Study Day 41. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel	57	256
Doxorubicin	284	543
Capecitabine	564	753
Letrozole	760	Ongoing
Alpelisib	781	816
Cyclophosphamide	837	Ongoing

On Study Day 864, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

1.9 NARRATIVES FOR PATIENTS WHO EXPERIENCED GRADE ≥ 3 RASH

Study Number/CRTN:	CO40016/307263	Patient number	2038
Demographics:	69-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 day cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 day cycle)		
Cohort	Cohort B		
Event (PT) Category:	Drug eruption AESI: Grade ≥ 3 rash		

The patient was randomized on Study Day -1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 negative locally advanced unresectable metastatic left breast cancer (T4cN1M1), on Study Day -72.

At screening sites of disease involvement included bone, lymph nodes (left axillary), and left breast

No past cancer treatment was reported.

No medical/surgical history was reported. The patient's concurrent conditions included cancer pain, and skin ulcer.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included guaiazulene and metronidazole.

Event: Drug eruption (Severe drug eruption)

Prior to the event of drug eruption, the most recent dose of paclitaxel was administered on Study Day 232 and ipatasertib (400 mg) on Study Day 238.

On Study Day 239, the patient was noted with severe non-serious Grade 2 drug eruption (site and presenting symptoms not reported). She received treatment with betamethasone, hydrocortisone, oxytetracycline, nadifloxacin, and prednisolone. On Study Day 701, the event of drug eruption worsened to Grade 3. She received further treatment with diflucortolone. On Study Day 827, the event of drug eruption improved to Grade 2. On Study Day 841, the event of drug eruption was considered resolved.

Due to the event of drug eruption, there was no change in the study treatment with paclitaxel; however, treatment with ipatasertib was interrupted on Study Day 652 and the next dose was given on Study Day 673.

The Investigator considered drug eruption, to be related to ipatasertib and other cause (unspecified) and unrelated to paclitaxel.

On Study Day 784, radiographic response assessment showed disease progression with new lesions in liver (S7).

On Study Day 777, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 771 and ipatasertib on Study Day 777. The patient entered into long-term follow-up phase.

On Study Day 841, the patient was lost to follow-up.

Other AEs experienced by patient during the study:

Contusion	1	Non-serious	780	799	Not Applicable	Not Applicable

Study Number/CRTN:	CO40016/307260	Patient number	2071
Demographics:	46-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Category:	Rash maculo-papular Grade ≥ 3 rash		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR positive and HER 2-negative metastatic left breast cancer (T2N1M1) on Study Day −705 following left breast biopsy.

At screening, sites of disease involvement included bone (multiple bone metastasis) and liver (right and left lobes). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Goserelin and tamoxifen	−658	−351
Surgery	Curative	Left partial mastectomy	−531	NA
Cancer therapy	Metastatic	Goserelin and anastrozole	−350	−295
Cancer therapy	Metastatic	Goserelin, exemestane and histone deacetylase unspecified	−294	−183
Cancer therapy	Metastatic	Goserelin, palbociclib and fulvestrant	−182	−36

No medical or surgical history was reported. Concurrent conditions included hyperuricemia, hepatic function abnormal and hypertension.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event: Rash maculo-papular

Prior to the event of rash maculo-papular, the most recent dose of paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) on Study Day 14. From Study Day 15, study treatment with ipatasertib was interrupted due to an event of Grade 2 neutrophil count decreased (non-serious, related).

On Study Day 16, the patient experienced non-serious Grade 1 itchy rash maculo-papular which gradually diffused and worsened to Grade 3 on Study Day 19. She was started on treatment with prednisolone, clemastine and betamethasone/dexchlorpheniramine maleate. On Study Day 29, the event of rash maculo-papular improved to Grade 2; however, itchiness and redness continued. Grade changes during the course of the event are reported in the table

below. She further received treatment with fexofenadine and betamethasone valerate. The event of rash maculo-papular remained unresolved at the time of study discontinuation.

Study Day	Grade changes for rash
19	3
29	2
36	1
77	2
85	1
161	2
166	1

Due to this event, there was no change in study treatment with paclitaxel; however, dose of ipatasertib was reduced to 300 mg from Study Day 36.

The Investigator considered rash maculo-papular, to be related to ipatasertib and unrelated to paclitaxel.

On Study Day 947, a radiographic response assessment showed disease progression. Subsequently, study treatment was permanently discontinued with the last dose of paclitaxel and ipatasertib given on Study Day 939 and Study Day 952, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatment	**Start Day**	**Stop Day**
Epirubicin (10 cycles) and cyclophosphamide (8 cycles)	966	Ongoing

On Study Day 1198, the patient was permanently discontinued from the study as per the physician's decision (LTFU terminated by Sponsor).

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304332	Patient number	2098
Demographics:	57-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Rash erythematous AESI: Grade ≥ 3 rash		
Event 2 (PT) Category:	Aspartate aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hepatotoxicity		

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/304640	Patient number	2135
Demographics:	59-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Rash AESI: Grade ≥ 3 rash		
Event 2 (PT) Category:	Dyspnea SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

Study Number/CRTN:	CO40016/305639	Patient number	2173
Demographics:	61-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Rash maculo-papular AESI: Grade ≥ 3 rash		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR positive and HER2 receptor equivocal, left breast cancer (T1cNxM0), approximately 7 years prior to study entry.

On Study Day -905, the patient was diagnosed with metastatic disease with ER/PR positive and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included liver, bone and chest (right pleural effusion). The patient was assessed by the Investigator to have endocrine resistant disease.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left lumpectomy	Approximately 7 years prior to study entry	NA
Radiotherapy	Adjuvant	Left breast (total dose unknown; 37 fractions)	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Cancer therapy	Adjuvant	Anastrozole	Approximately 7 years prior to study entry	-987
Cancer therapy	Metastatic	Palbociclib and letrozole	-896	-196
Cancer therapy	Metastatic	Palbociclib and fulvestrant	-196	-104
Cancer therapy	Metastatic	Exemestane and everolimus	-104	-43

The patient′s medical history included pneumonitis. No other surgical history was reported. Concurrent conditions included hypertension, post menopause, dyspepsia, rhinitis allergic, metastasis to bone, arthralgia (right shoulder) and right pleural effusion.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included calcium carbonate/cholecalciferol, esomeprazole, hydrochlorothiazide/lisinopril and denosumab.

Event: Rash maculo-papular

Prior to the event of rash maculo-papular, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 14.

On Study Day 15, the patient experienced non-serious Grade 3 maculo-papular rash. She had received two injections of filgrastim on Study Day 15 and Study Day 16 for neutrophil count decreased (for details please refer to other AEs table below) and the investigator felt that possibility of relationship of rash to filgrastim could not be ruled out. The investigator classified the eruption as generalized morbilliform (exanthematous; maculopapular) drug eruption. It was considered as minor non-exfoliative and non-ulcerative rash.

On Study Day 18, a biopsy performed to exclude other possibilities revealed superficial perivascular infiltrate containing numerous eosinophils and foci of subtle interface changes. All these features were entirely consistent with drug eruption secondary to ATK inhibitor (ipatasertib). However, filgrastim was not excluded as the cause of the event but was less likely related. She received treatment with triamcinolone for symptomatic relief of her minor pruritus and methylprednisolone (treatment details reported in table below). On Study Day 42, rash maculo-papular improved to Grade 1. On Study Day 56, the event of rash maculo-papular was considered as resolved.

On the same day (Study Day 56), radiographic response assessment showed disease progression. However, the patient continued to receive the study treatment as per the physician′s decision since the patient had received few doses of study treatment and measurements of the lesions were not available. Also, it was concluded that the patient was deriving benefit from the treatment.

Rash maculo-papular treatment details:

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Triamcinolone	Rash maculo-papular	0.1*	TO	BID	18	Ongoing
Methylprednisolone	Rash maculo-papular	4	PO	QID	21	22
Methylprednisolone	Rash maculo-papular	4	PO	Q3D	23	24
Methylprednisolone	Rash maculo-papular	4	PO	BID	25	26
Methylprednisolone	Rash maculo-papular	4	PO	QD	27	28

*Units: %

Due to the event of rash maculo-papular, Cycle 2 Day 1 dose of paclitaxel was interrupted, and ipatasertib was interrupted from Study Day 18. The next dose of paclitaxel was administered on Study Day 35 and ipatasertib on Study Day 42 at a reduced dose of 300 mg.

The Investigator considered rash maculo-papular to be related to ipatasertib and paclitaxel.

On Study Day 84, a repeat response assessment showed disease progression.

On Study Day 98, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 91 and ipatasertib on Study Day 97. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	98	203

On Study Day 401, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Cohort	Cohort B
Event (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day 1.

The patient was initially diagnosed with poorly differentiated, ER positive/PR positive and HER 2-receptor negative, right breast cancer (T4N2M0; histological subtype: not otherwise specified) on Study Day −84.

On Study Day −31, the patient was diagnosed with locally recurrent disease with ER/PR positive and HER2 negative disease in recurrent/metastatic tissue. At screening, sites of disease involvement included right breast (retro areolar lesion and anterior antero-lesion in glandular tissue) and right axillary adenopathy.

No past cancer treatment was reported.

No medical history was reported. The patient′s other surgical history included hysterectomy, cholecystectomy, benign breast lump removal and breast operation (duct excision). Concurrent conditions included hypertriglyceridemia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 were reported.

Event Alanine aminotransferase increased

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 1 and ipatasertib on Study Day 6.

On Study Day 7, a laboratory work-up showed ALT 226 U/L (normal range: 6-30 U/L) and AST 105 U/L (normal range: 9-31 U/L) and the patient was noted with non-serious Grade 3 alanine aminotransferase increased and Grade 2 aspartate aminotransferase increased (non-serious, unrelated). It was reported that the event was caused by guanabana leaves infusion which the patient took even though she was instructed not to take the infusion. No treatment was given for these events. On Study Day 28, the event of aspartate aminotransferase increased was considered resolved. On Study Day 35, the event of alanine aminotransferase increased was considered resolved.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 9-31 U/L	**ALT** Normal range: 6-30 U/L	**Total bilirubin** Normal range: 0.1-1 mg/dL	**ALP** Normal range: 35-104 U/L
Screening	18	20	0.64	134
7	105	226	1.32	186
14	50	119	1.15	216
28	21	40	0.67	191
35	14	21	0.72	156

There was no change in study treatment due to the event of alanine aminotransferase increased.

The Investigator considered alanine aminotransferase increased, to be unrelated to ipatasertib and paclitaxel and related to other causes.

On Study Day 371, study treatment was permanently discontinued as per physician decision (the principal investigator decided to discontinue the patient due to the need for surgery) with the last dose of paclitaxel given on Study Day 354 and ipatasertib on Study Day 361. The patient entered into long-term follow up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
″Other″ surgery of right breast	386	NA
Doxorubicin and cyclophosphamide	466	539
Anastrozole	582	Ongoing
Radiotherapy to breast and rib grid (dose: 5000 cGy and 25 fractions)	639	672

On Study Day 1187, the patient was lost to follow-up.

Other AEs experienced by the patient during the study:

Event	Most extreme Grade	Serious/ Non-Serious	Onset Day	Resolution Day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)
Hypertriglyceridemia	3	Non-serious	56	168	Unrelated	Unrelated

Event 3 (PT) Category:	Leukopenia AE leading to study treatment discontinuation		
Event 4 (PT) Category:	Neutropenia AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/304879	Patient number	2074
Demographics:	47-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event (PT) Category:	Alanine aminotransferase increased AESI: Grade $\geq$ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, ER/PR positive, HER2 negative, metastatic left breast cancer (T2N2M1; histological grade unknown) on Study Day −665.

At screening sites of disease involvement included liver (right S8 metastasis and multiple), bone (multiple) and chest wall nodule. The patient was assessed by the Investigator to have endocrine resistance.

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Metastatic	Palbociclib, exemestane and leuprorelin	−632	−38

No medical or surgical history was reported. Concurrent conditions included Grade 1 alanine aminotransferase increased and Grade 1 aspartate aminotransferase increased.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included zoledronic acid.

Event: Alanine aminotransferase increased (ALT increased)

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 29, a laboratory work-up showed worsening of pre-existing aspartate aminotransferase increased (non-serious, related) and alanine aminotransferase increased to Grade 2 (non-serious) with AST 130 U/L and ALT 156 U/L. On Study Day 36, the event of alanine aminotransferase increased further worsened to Grade 3 (ALT 291 U/L). She received

treatment with *Silybum marianum*, ursodeoxycholic acid and calcium pantothenate/cyanocobalamin/folic acid/nicotinamide/pyridoxine hydrochloride/riboflavin/thiamine mononitrate/zinc oxide. On Study Day 43, the events of alanine aminotransferase increased and aspartate aminotransferase increased were considered resolved.

Due to the event of alanine aminotransferase increased, study treatment with ipatasertib was interrupted on Study Day 29 and Cycle 2 Day 1 and Cycle 2 Day 8 doses of paclitaxel were not administered. The next dose of paclitaxel and ipatasertib was given on Study Day 43.

The Investigator considered alanine aminotransferase increased, to be related to ipatasertib and paclitaxel.

The patient was noted with another episode of Grade 2 alanine aminotransferase increased (non-serious, related to ipatasertib) from Study Day 57 to Study Day 71. Relevant laboratory work-up reported in the table below. Treatment with *Silybum marianum*, ursodeoxycholic acid and calcium pantothenate/ cyanocobalamin/ folic acid/ nicotinamide/ pyridoxine hydrochloride/ riboflavin/ thiamine mononitrate/ zinc oxide was maintained.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 1-40 U/L	**ALT** Normal range: 1-40 U/L	**Bilirubin** Normal range: 0.2-1.2 mg/dL	**ALP** Normal range: 30-115 U/L
Screening	71	76	0.6	181
29	130	156	0.6	249
36	170	291	0.6	328
43	61	115	0.7	345
57	93	143	0.4	256
71	56	93	0.4	229

On Study Day 274, a radiographic response assessment showed disease progression with progression of non-target lesions. On Study Day 278, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib given on Study Day 265 and Study Day 271, respectively. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Fulvestrant	278	307
Doxorubicin and Cyclophosphamide	335	356
Vinorelbine and capecitabine	424	Ongoing

On Study Day 524, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)

Diarrhea	1	Non-serious	237	277	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304332	Patient number	2098
Demographics:	57-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Rash erythematous AESI: Grade ≥ 3 rash		
Event 2 (PT) Category:	Aspartate aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hepatotoxicity		

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/304880	Patient number	2131
Demographics:	61-year-old Asian female		

Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)
Cohort:	Cohort B
Event 1 (PT) Category:	Alanine aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity
Event 2 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/305247	Patient number	2133
Demographics:	72-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event 1 (PT) Category:	Alanine aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		

A narrative for this patient is available under Section 1.4; Narratives for patients who experienced adverse events leading to study treatment discontinuation.

Study Number/CRTN:	CO40016/304786	Patient number	2136
Demographics:	48-year-old White male		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort:	Cohort B		
Event 1 (PT) Category:	Anxiety SAE		
Event 2 (PT) Category:	Alanine aminotransferase increased AESI: Grade ≥ 3 hepatotoxicity		

Event 3 (PT) Category:	Nausea AE leading to study treatment discontinuation
Event 4 (PT) Category:	Asthenia AE leading to study treatment discontinuation
Event 5 (PT) Category:	Fatigue AE leading to study treatment discontinuation

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

1.12 NARRATIVES FOR PATIENTS WHO EXPERIENCED POTENTIAL DRUG-INDUCED LIVER INJURY AS DEFINED BY HY'S LAW

No patient experienced potential drug-induced liver injury as defined by Hy's law while in the study.

1.13 NARRATIVES FOR PATIENTS WHO EXPERIENCED SUSPECTED TRANSMISSION OF AN INFECTIOUS AGENT BY THE STUDY DRUG

No patient experienced suspected transmission of an infectious agent by the study drug while in the study.

1.14 NARRATIVES FOR PATIENTS WHO EXPERIENCED COVID-19 SAE

Study Number/CRTN:	CO40016/305633	Patient number	2122
Demographics:	70-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle)		
Cohort	Cohort B		
Event (PT) Categories:	COVID-19 SAE, AE leading to study treatment discontinuation, COVID-19 SAE		

A narrative for this patient is available under Section 1.3; Narratives for patients who experienced serious adverse event(s).

TABLE OF CONTENTS

1. NARRATIVES

1.1 NARRATIVES FOR THE PATIENT WHO DIED DUE TO AN ADVERSE EVENT(S)

Study Number/CRTN:	CO40016/305639	Patient number	3016
Demographics:	62-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Peripheral motor neuropathy AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Fatigue AE leading to study treatment discontinuation		
Event 4 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 5 (PT) Categories:	Cardiac arrest Deaths due to adverse event, SAE		

The patient was randomized on Study Day – 1.

The patient was initially diagnosed with ductal, ER negative, PR positive and HER2 negative, left breast cancer (T1N0M0, histological grade unknown) approximately 4 years and 5 months prior to study entry.

On Study Day – 56, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative in metastatic tissue. At screening sites of disease involvement included lymph nodes (port hepatis node and other adenopathy/periaortic).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Simple Mastectomy of bilateral breast	Approximately 4 years and 4 months prior to study entry	NA

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	'Other' surgery of left lymph node	-862	NA
Cancer therapy	Adjuvant	Paclitaxel	-850	-721
Radiotherapy	Adjuvant	Left chest wall and superior vena cava fossa/axilla (dose: 5000 cGy and 25 fractions) and breast mastectomy scar (boost) (dose: 1000 cGy and 5 fractions)	-744	-703

The patient's medical history included basal cell carcinoma. Surgical history included appendicectomy, cholecystectomy and hysterectomy. Concurrent conditions included insomnia, hypertension, anxiety, gastroesophageal reflux disease, macular degeneration, asthma, and hyperglycemia.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab. On the same day (Study Day 1), the patient received loperamide prophylactically (total daily dose: 4 mg).

Concomitant medications ongoing at Study Day 1 included nadolol, hydrochlorothiazide/triamterene, lisinopril, salbutamol, escitalopram oxalate, cetirizine hydrochloride, lorazepam and loratadine.

On Study Day 4, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (details in the table below). The event of diarrhea was considered resolved on the same day.

On Study Day 6, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (details in the table below) and atropine sulfate/diphenoxylate hydrochloride. On Study Day 10, the event of diarrhea was considered resolved.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient experienced non-serious Grade 3 diarrhea. No diagnostic test was performed. It was reported that the patient was not taking treatment with atropine

sulfate/diphenoxylate hydrochloride properly and was re-educated to continue the treatment with atropine sulfate/diphenoxylate hydrochloride. She experienced 7-8 bowel movements during the event. On Study Day 13, the event of diarrhea was considered resolved.

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea, to be related to ipatasertib, paclitaxel and atezolizumab.

Loperamide details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	1
Diarrhea	2	PO	3	3
Diarrhea	4	PO	4	4
Diarrhea	2	PO	5	6
Diarrhea	4	PO	7	8
Diarrhea	2	PO	9	10

On Study Day 14, the patient experienced 5-6 bowel movements and was noted with Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with atropine sulfate/diphenoxylate hydrochloride for the event. On Study Day 29, it was reported that she did not have any further episodes of diarrhea and it was considered resolved.

Event 2: Peripheral motor neuropathy

Prior to the event of peripheral motor neuropathy, the most recent dose of atezolizumab was administered on Study Day 29, paclitaxel and ipatasertib (400 mg) on Study Day 36.

On Study Day 37, the patient was noted with non-serious Grade 1 peripheral motor neuropathy (presenting signs and symptoms not reported). She received treatment with gabapentin for the event of peripheral motor neuropathy. The event of peripheral motor neuropathy remained unresolved at the time of patient's death (see narrative below).

The Investigator considered peripheral motor neuropathy, to be unrelated to ipatasertib and atezolizumab and related to paclitaxel and other cause (unspecified).

Event 3: Fatigue

Prior to the event of fatigue, the most recent dose of atezolizumab was administered on Study Day 85, paclitaxel and ipatasertib (400 mg) on Study Day 92.

On Study Day 93, the patient experienced non-serious Grade 1 fatigue. She received treatment with ferric carboxymaltose for the event of fatigue. The event of fatigue remained unresolved at the time of patient's death (see narrative below).

The Investigator considered fatigue, to be unrelated to atezolizumab and related to paclitaxel, ipatasertib and other cause (unspecified).

Due to the events of peripheral motor neuropathy and fatigue, there was no change in study treatment with ipatasertib and atezolizumab, however, study treatment with paclitaxel was permanently discontinued with last dose administered on Study Day 113.

Event 4: Aspartate aminotransferase increased (AST increase)

Prior to the event of aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 113, atezolizumab on Study Day 183 and ipatasertib (400 mg) on Study Day 189.

On Study Day 169, the patient was noted with Grade 1 aspartate aminotransferase increased (AST: 64 U/L, normal range: 15-46 U/L) and Grade 2 blood lactate dehydrogenase increased (LDH: 746 U/L, normal range: 313-618 U/L) (both non-serious, unrelated). No treatment was administered for the events.

On the same day (Study Day 169), a CT of chest, abdomen and pelvis showed interval enlargement of portacaval and gastric hepatic ligament nodes with heterogeneity of hepatic enhancement. Non-specific hepatitis, reactive nodes and disease progression were suspected as the reason for this appearance.

On Study Day 170, an MRI of abdomen showed abnormal appearance of the liver with differential metastatic disease, drug induced hepatotoxicity or possibly and atypical appearance of untreated metastatic disease.

On Study Day 183, the patient was noted with Grade 1 alanine aminotransferase increased (ALT: 49 U/L, normal range: 11-66 U/L) and Grade 1 blood alkaline phosphatase increased (ALP: 142 U/L, normal range: 38-126 U/L) (both non-serious, unrelated). No treatment was administered for the events.

On Study Day 194, the event of aspartate aminotransferase increased was considered resolved.

On Study Day 195, the patient was noted with Grade 2 aspartate aminotransferase increased (AST value not reported) (non-serious, unrelated). No treatment was administered for the event.

On Study Day 196, abdominal ultrasound showed enlarged liver with pronounced parenchymal heterogeneity with no clearly definable focal hepatic mass identified. The abnormal appearance

of the liver was nonspecific with differential considerations including neoplastic and non-neoplastic processes indicated in prior MRI. It showed enlarged gastro hepatic/porta hepatis lymph nodes. Liver biopsy and CT scan were recommended.

On Study Day 204, the patient was noted with Grade 1 blood bilirubin increased (bilirubin: 1.50 mg/dL, normal range: 0.2-1.3 mg/dL) (non-serious, unrelated). No treatment was administered for the event. On Study Day 205, the event of blood bilirubin increased was considered resolved.

On Study Day 209, the event of aspartate aminotransferase increased was considered resolved.

On Study Day 210, the patient′s laboratory work-up showed: AST: 256 U/L (normal range: 15-46 U/L) and bilirubin: 2.30 mg/dL (normal range: 0.2-1.3 mg/dL), leading to diagnosis of non-serious Grade 3 aspartate aminotransferase increased and Grade 2 blood bilirubin increased (non-serious, unrelated). Relevant laboratory work-up throughout the event was not reported. No treatment was administered for the events. The event of aspartate aminotransferase increased was resolving and blood bilirubin increased blood lactate dehydrogenase increased, alanine aminotransferase increased, and blood alkaline phosphatase increased remained unresolved at the time of patient′s death (see narrative below).

Due to the event of aspartate aminotransferase increased, study treatment with atezolizumab was interrupted on Study Day 183, ipatasertib was interrupted on Study Day 189, and was never resumed later (see narrative below)

The Investigator considered aspartate aminotransferase increased, to be unrelated to ipatasertib and atezolizumab and related to other cause (unspecified) (causality relation with paclitaxel was NA).

On Study Day 212, an echocardiogram showed severe pulmonary hypertension, Left ventricular ejection fraction (LVEF): 67%, no left ventricular hypertrophy, mild diastolic dysfunction, severe pulmonary hypertension, right ventricular systolic pressure (RVSP): 81 mmHg, no pericardial effusion, no aortic dilatation, mild right atrial and right ventricular enlargement.

Event 5: Cardiac arrest

Prior to the event of cardiac arrest, the most recent dose of paclitaxel was administered on Study Day 113, atezolizumab on Study Day 183 and ipatasertib (400 mg) on Study Day 189. It was also the last dose prior to death.

On Study Day 215, the patient experienced respiratory distress, lost consciousness and hospitalized for life-threatening cardiac arrest. A chest compression was given and after 30 minutes of resuscitation the patient returned with spontaneous circulation. Chest X-ray showed cardiomegaly, diffuse bilateral airway disease, greater on left side than on right with a

suspected effusion layering out posteriorly on the left and no pneumothorax. Changes noted in lung were suspected due to progression and not considered as inflammatory changes. Relevant vital signs were not reported. Laboratory work-up showed troponin was elevated at: 0.251 ng/mL (normal value: $<$0.045 ng/mL), lactic acid: 14.1 mmol/L (normal range: 0.4-2.0 mmol/L), pH arterial: 7.21 (normal range: 7.34-7.45), pCO_2 arterial: 56 mmHg (normal range: 35-45 mmHg), pO_2 arterial: 113 mmHg (72-84 mmHg), lactate arterial: 17.0 mmoL (normal range: $<$2.00), base excess arterial: 6.2 mmol/L (normal range: 2-2 mmol/L), glucose: 69 mg/dL (70-110 mg/dL), blood urea nitrogen: 69 mg/dL (normal range: 7-18 mg/dL), carbon dioxide: 11 mmol/L (normal range: 21-32 mmol/L), potassium: 5.4 mmol/L (normal range: 3.5-5.0 mmol/L) and creatinine: 1.50 mg/dL (normal range: 0.60-1.30 mmol/L). An ECG showed atrial fibrillation with a competing junctional pacemaker and right bundle branch block. She received treatment with epinephrine, amiodarone, atropine, dobutamine, magnesium sulfate and sodium bicarbonate for the event of cardiac arrest. A few minutes later, she was reported to have lost pulse again due to which code was called and advanced cardiovascular life support (ACLS) was initiated. After another 30 minutes of resuscitation, no pulse was noted, and family decided to withdraw from any cardio resuscitative efforts. She remained pulseless. At 10:52 hours, the patient was pronounced dead. It was unknown whether an autopsy was performed or not.

There was no change in study treatment due to the event of cardiac arrest (action taken with paclitaxel was NA).

The Investigator considered cardiac arrest, to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to disease under study.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Gingival pain	1	Non-serious	26	28	Unrelated	Related	Related
Rash maculo-papular	1	Non-serious	80	84	Unrelated	Unrelated	Unrelated
Hyperglycemia	2	Non-serious	92	93	Related	Unrelated	Unrelated
Hypokalemia	2	Non-serious	112	120	Unrelated	Unrelated	Unrelated

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Nausea	1	Non-serious	177	Unresolved	Related	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305629	Patient number	3085
Demographics:	58-year-old American Indian or Alaska Native female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Categories:	Diarrhea SAE, Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Myositis SAE		
Event 3 (PT) Category:	Myocarditis SAE		
Event 4 (PT) Categories:	Pulmonary embolism Death due to adverse event, SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with unspecified histology, poorly differentiated, ER/PR and HER2 negative, metastatic left breast cancer (T3N2M1) on Study Day – 44.

At screening, sites of disease involvement included breast [left breast tumor, CSE (not otherwise specified) nodule left breast], liver (hepatic nodule segment VII), lymph nodes (left lateral axillary adenopathy, left axillary ganglion), mediastinum (subcarinal ganglion) and bone (multiple bone metastasis).

No past cancer treatments were reported.

No medical or surgical history was reported. The patient's concurrent conditions included arthralgia (hip) and hypothyroidism.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included levothyroxine and tramadol.

On Study Day 1, the patient started treatment with loperamide (total daily dose: 4 mg, PO) for diarrhea.

On Study Day 3, the patient experienced Grade 2 diarrhea (non-serious, related to paclitaxel and ipatasertib). She received treatment with loperamide (details in the table below). On Study Day 17, the event of diarrhea was considered resolved.

On Study Day 28, the patient experienced Grade 1 diarrhea (non-serious, unrelated). She received treatment with loperamide (details in the table below). On Study Day 60, the event of diarrhea was considered resolved.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 57, paclitaxel on Study Day 64 and ipatasertib (400 mg) on Study Day 67.

On Study Day 68, the patient experienced Grade 3 diarrhea (liquid stools up to 7 times per day persisting since 3 days) associated with general discomfort, nausea, and oral intolerance. She denied fever or any other additional manifestation. Upon physical examination abdomen was soft, depressible, painless, with increased airborne noise and no peritoneal signs. On Study Day 71, the event of diarrhea became serious, and she was hospitalized. She received treatment with loperamide (details in the table below), ciprofloxacin, dexamethasone and sodium chloride. Laboratory work-up was within normal range and stool cultures were without major findings. On Study Day 74, the event of diarrhea improved to Grade 2. On Study Day 78, the event of diarrhea improved to Grade 1. On Study Day 79, the event of diarrhea was considered resolved and she was discharged from the hospital.

Due to the event of diarrhea, there was no change in study treatment with atezolizumab, however, study treatment with ipatasertib was reduced to 300 mg on Study Day 95 and Cycle 3 Day 15 of paclitaxel was not administered. The next dose was given on Study Day 95.

The Investigator considered diarrhea, to be related to ipatasertib and paclitaxel and atezolizumab.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	Ongoing
Diarrhea	2	PO	71	77

Event 2: Myositis
Event 3: Myocarditis
Event 4: Pulmonary embolism (Pulmonar thromboembolia)

Prior to the events of myositis, myocarditis and pulmonary embolism, the most recent dose of atezolizumab and paclitaxel administered on Study Day 154 and paclitaxel (300 mg) on Study Day 157.

On Study Day 158, the patient experienced fatigue, chest pain and difficulty in walking. Her vitals showed heart rate 39 beats/min. She was diagnosed with serious Grade 3 myositis. On Study Day 159, the patient laboratory work-up showed lactate dehydrogenase 1163, total creatine phosphokinase 226, creatine phosphokinase-MB 370, glutamic-oxaloacetic transaminase 66, gamma-glutamyl transpeptidase 54 (units and normal ranges not reported), and troponin was negative. An ECG showed sinus rhythm, negative T waves in V1 to V4, II III segment, arteriovenous (AV) fistula with an axis minus 70 degrees, and QTc interval of 0.445. In addition, left anterior fascicular block and a diffuse repolarization disorder to d/c myocardial ischemia. An echocardiography showed conserved systolic function. She was diagnosed with life threatening serious Grade 4 myocarditis. She received treatment with morphine and dexamethasone. The patient had persistent symptoms of muscle weakness with greater intensity in the legs. On Study Day 162, the symptoms of dyspnea and chest pain worsened. She also experienced orthopnea, thoracic pain and a stiff chest. She was noted with heart rate of 39 beats/min. Laboratory work-up showed: glutamic-oxaloacetic transaminase: 83, gamma-glutamyl transpeptidase: 63, lactate dehydrogenase: 1284, total creatine phosphokinase: 220, Creatine phosphokinase-MB: 455 and D-dimer was 6.7 mg/L (normal range not reported). On the same day (Study Day 162), she was hospitalized and TEM thoracic ART angio tomography showed no evidence of pulmonary thromboembolism. Relevant vitals throughout the events were not reported. She received treatment with paracetamol, ceftriaxone, dexamethasone, enoxaparin, omeprazole, enoxaparin and oxygen. COVID test was negative on Study Day 162 and Study Day 163. On Study Day 163, the patient died suddenly with chest pain and respiratory failure and pulmonary embolism was concluded as the cause of death (initial intensity was Grade 4). An autopsy was not performed. The events of myositis and myocarditis remained unresolved at the time of patient's death.

Due to the events of myositis and myocarditis, study treatment with atezolizumab and paclitaxel was interrupted on Study Day 154 and ipatasertib was interrupted on Study Day 157 and was never resumed later (see below).

Due to the event of pulmonary embolism, study treatment with atezolizumab, ipatasertib and paclitaxel was permanently discontinued with last dose of atezolizumab, and paclitaxel administered on Study Day 154 and ipatasertib on Study Day 157.

The Investigator considered myositis, myocarditis and pulmonary embolism, to be unrelated to ipatasertib and paclitaxel and related to atezolizumab and other unspecified cause.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)

Study Number/CRTN:	CO40016/305629	Patient number	3090
Demographics:	54-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Categories:	Suspected COVID-19 Death due to AE, SAE, AE leading to study treatment discontinuation, COVID-19 SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T4bN2M1) on Study Day − 40.

At screening, sites of disease involvement included liver (hepatic nodule segment IV and VII), tumor left breast, lymph node (retropectoral ganglion conglomerate and left axillary adenopathy).

No past cancer treatments are reported.

No medical/surgical history was reported. No concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, atezolizumab and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Suspected COVID-19 (suspected covid-19 infection)

Prior to the event of suspected COVID-19, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 106 and ipatasertib (400 mg) on Study Day 111.

On Study Day 112, the patient experienced fever (body temperature not reported), pharyngeal pain, nasal congestion, and pharyngeal pain and received symptomatic treatment at home. From Study Day 113 to Study Day 115, her fever continued along with worsening of her general discomfort. On Study Day 116, the patient experienced dyspnea and lung X-ray revealed multifocal pneumonia and suspected severe COVID-19. Subsequently, she was hospitalized. Upon admission, her oxygen saturation was 91% which raised to 95% on binasal cannula. On an unspecified day, oxygen saturation decreased to 92% and then to 91% and she was put on

oxygen support with reservoir mask at 10 L per minute. It was reported that patient might got exposed while being mobilized in taxi for treatment cycle or got infected from her brother. She received treatment with ceftriaxone, hydroxychloroquine, azithromycin, enoxaparin, and paracetamol. On the following day (Study Day 117), a chest tomography revealed poorly defined patched spotlights, peripherally distributed, lustered glass in apical segments of upper and more diffused lobes in middle right lobe, upper and lower left lingula segment and in bilateral basal posterior segment associated with bindings in lower left lingula segment and in bilateral basal posterior segment. A laboratory work-up showed glucose 112 mg/dL, urea 22 mg/dL, creatinine 0.45 mg/dL, WBC count 10100 mil/mm^3, neutrophils 79%, lymphocytes 13%, monocytes 5%, eosinophils 1% and 2% bastons, platelet count 386,000 mil/mm^3, AST 38 U/L, ALT 19 U/L, DHL 703 U/L, protein C-reactive (PCR) 18.6 mg/dL, prothrombin time 13.1 and INR 1.19. Despite of treatment administration, on Study Day 120, her oxygen saturation was decreased to 87% showed progressive deterioration and due to collapse of health system mechanical ventilation was not provided. She also received treatment with hyoscine, dimenhydrinate and fentanyl. On Study Day 121, blood samples showed CPK-MB 29 U/L, creatinine 0.31 mg/dL, glucose 45 mg/dL, DHL 800 U/L, ALP 143 U/L, potassium 2.87 mmol/L, sodium 144 mmol/L, ALT 21 U/L, AST 16 U/L, troponin T < 0.003, urea 23 mg/dL, WBC count 12800×10^3/L, neutrophils 73%, lymphocytes 21%, monocytes 4%, prothrombin time 12.6, INR 1.14, PTT 40, PCR 27.5 mg/dL and fibrinogen 767. On Study Day 124, the patient died due to COVID-19 and progressive deterioration. An autopsy was not performed.

Relevant vitals reported in the table below:

Study Day	**Body temperature** (°C)	**Blood pressure** (mmHg)	**Respiratory rate** (breaths per minute)	**Pulse rate** (beats per minute)
-6	37	118/82	16	72
106	36	120/70	20	74
106	36.6	120/60	20	86
106	36.4	110/70	20	91

Relevant laboratory work-up reported in the table below:

Study Day	**WBC count** (normal range: 4.5-11 $\times 10^3/\mu L$)	**Absolute neutrophil count** (normal range: 1.8-8.2 $\times 10^3/\mu L$)	**Absolute lymphocyte count** (normal range: 1-4.8 $\times 10^3/\mu L$)
-2	11.33	7.02	3.34
91	7.54	4.82	1.97
98	5.77	3.22	2.15
105	4.47	2.34	1.78

Due to this event, study treatment with atezolizumab, paclitaxel and ipatasertib was permanently discontinued with the last dose given on Study Day 106 and Study Day 111 respectively.

The investigator considered suspected COVID-19 to be unrelated to atezolizumab, paclitaxel and ipatasertib and related to other causes.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Hyperglycemia	1	Non-serious	2	Unresolved	Related	Unrelated	Unrelated
Vomiting	1	Non-serious	2	2	Unrelated	Related	Unrelated
Hyperglycemia	2	Non-serious	2	2	Related	Unrelated	Unrelated
Diarrhea	2	Non-serious	3	10	Related	Unrelated	Unrelated
Diarrhea	2	Non-serious	11	17	Related	Unrelated	Unrelated
Alopecia	1	Non-serious	24	Unresolved	Unrelated	Related	Unrelated
Upper respiratory tract infection	2	Non-serious	41	49	Unrelated	Related	Unrelated
Diarrhea	1	Non-serious	57	77	Related	Unrelated	Unrelated
Nausea	1	Non-serious	57	77	Related	Unrelated	Unrelated
Diarrhea	1	Non-serious	80	97	Related	Unrelated	Unrelated
Nausea	1	Non-serious	92	105	Related	Unrelated	Unrelated

1.2 NARRATIVES FOR PATIENTS WHO DIED DUE TO DISEASE PROGRESSION

Study Number/CRTN:	CO40016/304634	Patient number	3026
Demographics:	50-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER/PR negative and HER2 negative left breast cancer (T2N0M0) (histopathology unknown), approximately 2 years and 7 months prior to study entry.

The patient was diagnosed with metastatic disease on Study Day − 50 with ER /PR status unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included midline (pleura behind the sternum and soft tissue sternum), liver (bilateral segment IVB, V and VI), bone (midline sacrum with a soft tissue tumor), chest (midline nodular infiltrate at the sternum), pleura (nodular infiltrates merging with lymph nodes), liquid pleural cavity, bilateral liver, whole bone, and chest (midline nodular infiltrate).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 2 years and 6 months prior to study entry	Approximately 2 years and 4 months prior to study entry
Cancer therapy	Neoadjuvant	Paclitaxel (12 cycles)	Approximately 2 years and 3 months prior to study entry	Approximately 2 years prior to study entry
Surgery	Curative	Left radical mastectomy	Approximately 1 years 11 months prior to study entry	–
Radiotherapy	Metastatic	Sternum (dose:20 cGy; 5 fractions)	−23	−19

No medical/surgical history was reported. The patient′s concurrent conditions included lower back pain, chest pain and hypertension.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included bisoprolol, telmisartan and zoledronic acid.

On Study Day 297, study treatment was permanently discontinued due to symptomatic deterioration (neurologic symptoms, weakness, bone, joints pain and dizziness) with the last dose of atezolizumab given on Study Day 282, paclitaxel on Study Day 289 and ipatasertib on Study Day 290. The patient entered into long-term follow-up.

On Study Day 318, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipataseritib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	5	6	Related	Unrelated	Unrelated
Diarrhea	2	Non-serious	10	11	Related	Unrelated	Unrelated
Diarrhea	2	Non-serious	14	16	Related	Unrelated	Unrelated
Diarrhea	2	Non-serious	18	18	Related	Unrelated	Unrelated
Diarrhea	2	Non-serious	20	23	Related	Unrelated	Unrelated
Rash	2	Non-serious	25	29	No	Related	Unrelated
Diarrhea	2	Non-serious	30	35	Related	Unrelated	Unrelated

Neutropenia	2	Non-serious	212	233	Unrelated	Unrelated	Related
Blood triglycerides increased	1	Non-serious	254	Unresolved	Unrelated	Related	Unrelated

Study Number/CRTN:	CO40016/304792	Patient number	3048
Demographics:	52-year-old female (Unknown race)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Rash SAE		
Additional category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated-Grade 2, ER/PR negative and HER2 negative left breast cancer (T4N2M1), on Study Day − 56.

At screening, sites of disease involvement included left breast (superior lateral), right axillary lymph node, left side of chest (subcutaneous region on the left lateral face of the chest-abdomen transition-hypochondrium region) and anterior wall of the upper third of the left hemithorax, involving the left subclavian artery, right axillary and inter and retro pectoral lymph node enlargement, as well as prominent prepericardial lymph nodes, bilateral skin nodular formations representing secondary lesions spread throughout the subcutaneous trunk region and liver (nodular lesion in the liver-kidney space).

No past cancer treatments are reported.

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension, thrombosis, pain in extremity (upper left limb) and edema peripheral (upper left limb).

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included hydrochlorothiazide, metamizole, codeine/paracetamol and nifedipine.

Event: Rash

Prior to the event of rash, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel Study Day 22 and ipatasertib (400 mg) on Study Day 28.

On Study Day 29, at 12:20 hours, Cycle 2 of the atezolizumab infusion started. No pre-medications were reported. Towards the end of atezolizumab infusion, she experienced systemic infusion reaction due to medically significant Grade 2 rash associated with itching and plaques all over body. At 12:58 hours infusion with atezolizumab was completed. She received treatment with diphenhydramine and dexamethasone. Later, on the same day (Study Day 29), the event of rash was considered resolved.

Due to this event, there was no change in the study treatment with ipatasertib and paclitaxel; however, Cycle 2 Day 15 of atezolizumab was delayed and given on Study Day 43.

The Investigator considered rash to be unrelated to paclitaxel and ipatasertib and related to atezolizumab.

On Study Day 106, a radiographic response assessment showed disease progression with new pleural effusion to the left.

On Study Day 113, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab given on Study Day 99 and ipatasertib on Study Day 105. The patient entered into the long-term follow-up.

On Study Day 127, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Infected neoplasm	1	Non-serious	4	15	Unrelated	Unrelated	Unrelated
Blood alkaline phosphatase increased	1	Non-serious	14	63	Unrelated	Unrelated	Related
Anemia	2	Non-serious	21	Unresolved	Unrelated	Unrelated	Related
Hyperglycemia	1	Non-serious	28	63	Related	Unrelated	Unrelated
Weight decreased	1	Non-serious	36	57	Unrelated	Unrelated	Unrelated
Diarrhea	2	Non-serious	43	50	Related	Unrelated	Related

Alopecia	1	Non-serious	57	Unresolved	Unrelated	Unrelated	Related
Hyperglycemia	1	Non-serious	70	85	Related	Unrelated	Unrelated
Blood alkaline phosphatase increased	1	Non-serious	85	Unresolved	Unrelated	Unrelated	Related

Study Number/CRTN:	CO40016/319619	Patient number	3062
Demographics:	52-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Blood glucose increased Grade ≥ 3 hyperglycemia		
Event 2 (PT) Category:	Diabetes mellitus Grade ≥ 3 hyperglycemia		
Additional category:	Death due to disease progression		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated ER/PR negative and HER2 negative right breast cancer (T2NXM1) on Study Day − 86.

On Study Day −41, the patient was diagnosed with metastatic disease with ER/PR negative and HER 2 negative in metastatic tissue. At screening sites of disease involvement included bilateral liver (segment VI and segment IV B), right breast (upper inner quadrant), right lung (segment VIII).

No past cancer treatments are reported.

The patient′s medical history included left ovarian cyst. No surgical history was reported. Concurrent conditions included hypertension, obesity, abdominal pain upper, and hyperglycemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medication ongoing at Study Day 1 included amlodipine/indapamide/perindopril, timonacic.

Event 1: Blood glucose increased (Elevated level of glucose)
Event 2: Diabetes mellitus

Prior to the events of blood glucose increased and diabetes mellitus, the most recent dose of atezolizumab was administered on Study Day 170, paclitaxel on Study Day 180 and ipatasertib (200 mg) on Study Day 186.

On Study Day 187, the patient presented to the hospital due to severe weakness. A laboratory work-up showed glucose 14.93 mmol/L (normal range: 3.9-5.5 mmol/L). The patient was diagnosed with non-serious Grade 3 blood glucose increased and non-serious Grade 3 diabetes mellitus.

On the same day (Study Day 187), an overall response assessment showed disease progression with new lesions in liver (increased metastasis).

It was reported that diabetes was related to unspecified steroid therapy. The patient received insulin therapy. The events of blood glucose increased, and diabetes mellitus were considered resolving at the time of patient's death (see narrative below).

Relevant laboratory work-up:

Study Day	**Glucose** Normal range: 3.9-5.5 mmol/L	**HbA1c** Normal range: 0-53 mmol/mol
Screening	5.84	43
187	14.93	–
190	17.27	55

There was no change in the study treatment due to the event of diabetes mellitus.

Due to the event of blood glucose increased, there was no change in the study treatment with atezolizumab and paclitaxel. However, study treatment with ipatasertib interrupted after Study Day 186 and later permanently discontinued due to disease progression (see narrative below).

The Investigator considered blood glucose increased and diabetes mellitus to be unrelated to paclitaxel, atezolizumab and ipatasertib and related to disease under study and concomitant medication (unspecified steroid therapy).

On Study Day 190, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab administered on Study Day 170, paclitaxel on Study Day 180 and ipatasertib on Study Day 186. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Cisplatin (single cycle)	190	190

On Study Day 211, the patient died due to disease progression. It was unknown whether an autopsy was or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Mucosal inflammation	1	Non-serious	7	29	Unrelated	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304332	Patient number	3093
Demographics:	54-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) + Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Category:	Death due to disease progression		

The patient was randomized on Study Day – 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative, right breast cancer (T4N1M0), approximately 3 years prior to study entry.

On Study Day – 418, the patient was diagnosed with metastatic disease (ER/PR status was unknown and HER2 status not assessed in metastatic tissue). At screening, sites of disease involvement included left breast, bilateral lungs, peritoneum, bilateral ascites, and bone (TH4, TH11, sacral, bilateral iliac).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Cyclophosphamide and doxorubicin (6 cycles each)	Approximately 2 years and 11 months prior to the study entry	– 982
Surgery	Curative	Right breast radical mastectomy	– 959	–
Radiotherapy	Adjuvant	Scar after right breast mastectomy (dose: 46 cGy); iliac bone (dose: 30 cGy); axillary lymph node (dose: 40 cGy); and sub upper clavicular and right parasternal lymph node (dose: 36 cGy)	– 938	– 905

The patient′s medical history included syncope and hypothyroidism. No other surgical history was reported. Concurrent conditions included pain in extremity, goiter, chronic sinusitis, inguinal hernia, hepatic cyst, and renal cyst.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medication ongoing at Study Day 1 included tramadol.

On Study Day 59, a radiographic response assessment showed disease progression with new lesions in right pleural cavity (pleural effusion).

On Study Day 64, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel, atezolizumab and ipatasertib given on Study Day 43 and Study Day 57 and Study Day 63, respectively. The patient entered into long-term follow-up.

On Study Day 84, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Dyspnea	1	Non-serious	9	19	Related	Related	Unrelated
Neutropenia	2	Non-serious	15	22	Unrelated	Related	Unrelated
Sinus tachycardia	1	Non-serious	16	Unresolved	Unrelated	Unrelated	Unrelated
Anemia	2	Non-serious	22	Unresolved	Unrelated	Related	Unrelated

1.3 NARRATIVES FOR PATIENTS WHO EXPERIENCED SERIOUS ADVERSE EVENT

Study Number/CRTN:	CO40016/319067	Patient number	3001
Demographics:	55-year-old female (race unknown)		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Categories:	Dystonia SAE, AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Mixed connective tissue disease AE leading to study treatment discontinuation		

Event 3 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea
Event 4 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea
Event 5 (PT) Category:	Skin infection SAE
Event 6 (PT) Category:	Vomiting SAE
Event 7 (PT) Categories:	Alanine aminotransferase increased SAE, Grade ≥ 3 hepatotoxicity
Event 8 (PT) Categories:	Aspartate aminotransferase increased SAE, Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day − 1.

The patient was diagnosed with ductal, poorly differentiated ER/PR negative, and HER2 negative right breast cancer (T3N1cMX) approximately 2 years and 9 months prior to study entry.

On Study Day −33, the patient was diagnosed with advanced unresectable disease with ER/PR negative and HER 2 negative. At screening, sites of disease involvement included lymph nodes (bilateral axillary) and right breast.

No past cancer treatment was reported.

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension, anxiety, breast pain, and blood lactate dehydrogenase increased.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	1	Ongoing

Concomitant medications ongoing at Study Day 1 included famotidine, bisoprolol/hydrochlorothiazide, lorazepam, and tramadol.

Event 1: Dystonia
Event 2: Mixed connective tissue disease

Prior to the event of dystonia, the most recent dose of atezolizumab was administered on Study Day 29, paclitaxel on Study Day 36, and ipatasertib (400 mg) was administered on Study Day 34.

On Study Day 37, the patient experienced Grade 3 dystonia (initial intensity Grade 2, symptoms not reported). On Study Day 42, she was hospitalized. A CT scan and MRI of brain were normal. Hematology and chemistry work-up was within normal range. The cerebrospinal fluid analysis was normal. She received treatment with prednisone. On Study Day 45, the event of dystonia was considered resolved and she was discharged from the hospital.

Prior to the event of mixed connective tissue disease, the most recent dose of atezolizumab was administered on Study Day 29, paclitaxel on Study Day 50, and ipatasertib (400 mg) was administered on Study Day 41.

On Study Day 51, a laboratory work-up showed rheumatoid factor $<$ 10 IU/mL and C-reactive protein 45.2 (units and normal range not reported). The patient was diagnosed with non-serious Grade 2 mixed connective tissue disease. She received treatment with hydroxychloroquine, prednisone, and azathioprine. The event of mixed connective tissue disease remained unresolved at the time of patient's death (see narrative below).

Due to the event of mixed connective tissue disease, there was no change in the study treatment with ipatasertib and paclitaxel.

Due to the event of dystonia, Cycle 2 Day 15 of paclitaxel was delayed and was administered on Study Day 50 and treatment with ipatasertib was interrupted on Study Day 42 and the next was dose given on Study Day 59.

Due to the events of dystonia and mixed connective tissue disease study treatment with atezolizumab was permanently discontinued with the last dose given on Study Day 29.

The Investigator considered dystonia and mixed connective tissue disease to be unrelated to ipatasertib and paclitaxel and related to atezolizumab and other cause (unspecified).

On Study Day 69, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide.

Event 3: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and ipatasertib (400 mg) was administered on Study Day 71.

On Study Day 72, the ongoing event of diarrhea worsened to non-serious Grade 3 (more than 7 episodes). Treatment with loperamide was maintained and she also received diphenoxylate/atropine without any improvement; thus, dose of loperamide was increased (details not reported) and on Study Day 73, the event of diarrhea was considered resolved.

Due to the event of diarrhea, there was no change in the study treatment with paclitaxel; however, ipatasertib was interrupted on Study Day 72 and the next dose was given on Study Day 74 at a reduced dose of 300 mg from 400 mg.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Event 4: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel was administered on Study Day 71 and ipatasertib (300 mg) was administered on Study Day 76.

On Study Day 77, the patient experienced non-serious Grade 3 diarrhea. Treatment with loperamide was maintained. On Study Day 80, the event of diarrhea improved to Grade 1. She further received treatment with cholestyramine. On Study Day 154, the event of diarrhea was considered resolved.

Due to the event of diarrhea, Cycle 4 Day 1 of paclitaxel was delayed and treatment with ipatasertib was interrupted on Study Day 80. The next dose of paclitaxel and ipatasertib (at a reduced dose of 200 mg from 300 mg) was given on Study Day 85.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

The patient received on-study anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy (left breast; 3600 cGy, 12 fractions)	107	123

Event 5: Skin infection
Event 6: Vomiting

Prior to the events of skin infection and vomiting, the most recent dose of paclitaxel and ipatasertib was administered (200 mg) was administered on Study Day 99.

On Study Day 123, the patient was noted with wound on the right breast and new discharge areas. She was diagnosed with Grade 2 skin infection. Treatment vancomycin and cefepime was started. On Study Day 124, she experienced Grade 3 vomiting and Grade 2 abdominal pain (non-serious, unrelated). On Study Day 126, the vomiting became uncontrollable associated

with nausea and ongoing abdominal pain. Subsequently, she was hospitalized. Upon admission, her vitals showed body temperature 98.4°F, pulse 99 bpm, blood pressure 107/69 mmHg, respiratory rate 17 breaths/min, and peripheral capillary oxygen saturation 97%. A chest X-ray showed no radiographic evidence of acute cardiopulmonary disease. A CT scan of abdomen and pelvis showed no acute inflammatory or obstructive abnormality. Later, on the same day (Study Day 126), the event of skin infection was considered worsened to Grade 3. She was also diagnosed with cellulitis. She received treatment with ondansetron, and promethazine. On Study Day 127, the event of vomiting was considered resolved. On Study Day 135, she was discharged from the hospital on doxycycline. On Study Day 149, the event of skin infection was considered resolved. On Study Day 154, the event of abdominal pain was considered resolved.

There was no change in the study treatment due to the events of skin infection and vomiting.

The Investigator considered skin infection to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to disease under study and radiotherapy.

The Investigator considered vomiting to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to radiotherapy and other cause (unspecified).

Event 5: Alanine aminotransferase increased (Elevated ALT)
Event 6: Aspartate aminotransferase increased (Elevated AST)

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 197 and ipatasertib (200 mg) was administered on Study Day 202.

On Study Day 203, a laboratory work-up showed AST 252 U/L (normal range: 0-40 U/L), ALT 220 U/L (normal range: 0-23 U/L), ALP 232 U/L (normal range: 39-117 U/L), and bilirubin 0.3 mg/L (normal range: 0-1.2 mg/dL). The patient was diagnosed with Grade 3 alanine aminotransferase increased and Grade 3 aspartate aminotransferase increased. On Study Day 211, she was hospitalized due to elevated liver enzymes associated with epigastric pain radiating to the back, vomiting and decreased appetite. Treatment with proton pump inhibitor was started, however without response. Ultrasound showed hepatic steatosis but normal common bile duct. It was reported that the elevated liver enzyme was due to azathioprine (given for mixed connective tissue disease from Study Day 187 to Study Day 211) and was thus permanently discontinued. On Study Day 213, the event of ALT increased improved to Grade 2 which further improved to Grade 1 on Study Day 217. On Study Day 219, she was discharged from the hospital. On Study Day 218, the event of alanine aminotransferase increased, and aspartate aminotransferase increased were considered resolved.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 0-40 U/L	**ALT** Normal range: 0-32 U/L	**Total bilirubin** Normal range: 0-1.2 mg/dL	**ALP** Normal range: 39-117 U/L
Screening	40	40	0.2	133
203	252	220	0.3	232
210	371	266	0.2	300
218	20[a]	59[b]	0.6[c]	161[d]

[a]normal range: 0-37 U/L, [b]normal range: 0-65 U/L, [c]normal range: 0.2-1.3 mg/dL, [d]normal range: 39-136 U/L

Due to the events of alanine aminotransferase increased, and aspartate aminotransferase increased Cycle 8 Day 15 was not administered, and the next dose was given on Study Day 225. Treatment with ipatasertib was interrupted after Study Day 210 and the next dose was given on Study Day 232.

The Investigator considered alanine aminotransferase increased, and aspartate aminotransferase increased to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to concomitant medication (azathioprine; given of mixed connective tissue disease).

On Study Day 224, an overall response assessment showed disease progression with new lesions in liver.

On Study Day 241, study treatment with paclitaxel and ipatasertib was permanently discontinued due to disease progression with the last dose of paclitaxel and ipatasertib was administered on Study Day 239. The patient then entered the long-term follow-up.

The patient received on-study anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Olaparib	253	378

On Study Day 511, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Constipation	1	Non-serious	7	15	Related	Unrelated	Unrelated

Study Number/CRTN:	CO40016/305639	Patient number	3002
Demographics:	43-year-old Black or African American female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Vomiting SAE		
Event 2 (PT) Category:	Diarrhea SAE		
Event 3 (PT) Category:	Pyrexia SAE		
Event 4 (PT) Category:	Pneumonia SAE		
Event 5 (PT) Category:	Flushing AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative right breast cancer (T2N0M0) approximately 3 years prior to study entry followed by right lumpectomy performed approximately 2 years and 11 months prior to study entry.

The patient was diagnosed with metastatic disease on Study Day −14 with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lymph node (bilateral supraclavicular, left anterior posterior window, bilateral mediastinal and retroperitoneal), right left lower pleural cavity, liver segment 7 and pancreatic tail lesion, right chest pleural metastasis and hepatic liver metastasis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide	Approximately 2 years and 10 months prior to study entry	Approximately 2 years and 9 months prior to study entry
Cancer therapy	Adjuvant	Paclitaxel	Approximately 2 years and 9 months prior to study entry	Approximately 2 years and 7 months prior to study entry
Radiotherapy	Adjuvant	Right breast (dose: 2937 cGy; 11 fractions)	Approximately 2 years and 7 months prior to study entry	Approximately 2 years and 6 months prior to study entry

The patient′s medical history included pleural effusion. Surgical history included female sterilization and ligament operation (right ACL). Concurrent conditions included nausea, back pain, dyspnea, anxiety, seasonal allergy, flank pain, non-cardiac chest pain, decreased appetite and fatigue.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included prochlorperazine, ondansetron and oxycodone/paracetamol.

On Study Day 9, the patient experienced Grade 1 vomiting (non-serious, related to ipatasertib). No treatment was reported for vomiting. Later, on the same day, the event of vomiting was considered resolved.

Event 1: Vomiting

Event 2: Diarrhea

Event 3: Pyrexia (Fever)

Event 4: Pneumonia (Lung infection)

Prior to the events of vomiting, diarrhea, pyrexia and pneumonia, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 1, and ipatasertib (400 mg) on Study Day 11.

On Study Day 11, the patient started paclitaxel infusion at 12:14 hours, during infusion, the patient experienced Grade 3 dyspnea (non-serious, related to paclitaxel; oxygen saturation 81%), Grade 3 anxiety (initial intensity Grade 2; non-serious, unrelated), Grade 1 vomiting, and Grade 1 diarrhea. Subsequently, she was hospitalized. She received treatment with loperamide (details reported in table below) for diarrhea. Later, the infusion of paclitaxel was stopped at 12:20 hours. The patient had history of pleural effusion and she underwent right thoracentesis and 1700 mL of fluid was removed. She received treatment with diphenhydramine, famotidine, methylprednisolone, salbutamol, and prednisone for dyspnea and was kept on oxygen therapy with 4 L oxygen with oxygen saturation 88-89%. Her symptoms resolved 10 minutes post treatment. On Study Day 11, the events of vomiting and diarrhea were considered resolved.

Prior to the events of pyrexia and pneumonia, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel and ipatasertib (400 mg) on Study Day 11.

On Study Day 13, her vitals showed body temperature 39°C with tachycardia (heart rate not reported) and hypotension (blood pressure not reported). A laboratory work-up showed WBC count 6.4 $\times 10^3/\mu L$ (normal range: 4.2-10.2 $\times 10^3/\mu L$). A chest X-ray revealed worsening in diffused right lung infiltrate with persisting moderate right effusion. The patient was diagnosed with Grade 2 pyrexia and Grade 3 pneumonia, leading to prolonged hospitalization. On Study Day 15, a pleural catheter was placed for the drainage of pleural fluid with leads to improvement in dyspnea. At 15:23 hours, a laboratory work-up showed troponin level 0.203 (normal range: 0-0.45; units not reported), and at 21:40 hours, 0.160 (normal range: 0-0.45). A blood culture was negative. She received treatment with vancomycin and cefepime for pyrexia and pneumonia. On Study Day 18, the events of pyrexia and pneumonia were considered resolved and she was discharged from the hospital. On Study Day 21, the event of anxiety was considered resolved. On Study Day 32, the event of dyspnea was considered resolved

Loperamide details:

Indication	Loperamide daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	8	PO	1	2
Diarrhea	2	PO	7	10
Diarrhea	4	PO	11	11

Relevant laboratory values listed in the table below:

Study Day	**WBC count** (normal range: 4.6-10.2 $\times$ $10^3/\mu L$)	**Absolute neutrophil count** (normal range: 2-6.9 $\times$ $10^3/\mu L$)	**Absolute lymphocyte count** (normal range: 0.6-3.7 $\times$ $10^3/\mu L$)	**Body temperature** (°C)
– 4	4.6	3	1.1	35.9
11	5.6	4.1	0.8	36.7
21	7.6	4.4	1.9	—

Due to the events of vomiting and diarrhea, there was no change in study treatment with ipatasertib and atezolizumab; however, Cycle 1 Day 8 of paclitaxel was delayed, and the next dose given on Study Day 11.

Due to the events of pyrexia and pneumonia, there was no change in study treatment with atezolizumab; however, Cycle 1 Day 15 of paclitaxel was delayed and study treatment with ipatasertib was interrupted on Study Day 12. The next dose was given on Study Day 21.

The Investigator considered vomiting to be related to ipatasertib and paclitaxel and unrelated to atezolizumab.

The Investigator considered diarrhea to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

The Investigator considered pyrexia and pneumonia to be unrelated to atezolizumab, ipatasertib and paclitaxel and related to other causes (unspecified).

Event 5: Flushing

Prior to the event of flushing, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 21 and ipatasertib (400 mg) on Study Day 22.

On Study Day 32, at 15:43 hours, the patient started treatment with paclitaxel infusion. The infusion was started slow and within 22 minutes, the patient experienced Grade 3 dyspnea (non-serious, related to paclitaxel; oxygen saturation 91% on room air) and Grade 2 face flushing. The paclitaxel infusion was stopped at 16:06 hours. She received 2 L oxygen therapy and treatment with diphenhydramine, methylprednisolone and sodium chloride for flushing and dyspnea. Post treatment, her vitals improved, and oxygen saturation was 97%. On Study Day 32, the event of flushing was considered resolved.

Due to this event, there was no change in study treatment with ipatasertib and atezolizumab; however, paclitaxel was permanently discontinued with the last dose given on Study Day 32.

The Investigator considered flushing, to be unrelated to atezolizumab and ipatasertib and related to paclitaxel and other causes (unspecified).

On Study Day 39, a radiographic response assessment showed disease progression

On Study Day 44, study treatment with atezolizumab and ipatasertib was permanently discontinued due to disease progression with the last dose of atezolizumab given on Study Day 32 and ipatasertib on Study Day 38. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Sacituzumab (6 cycles), eribulin (2 cycles), docetaxel (4 cycles), bevacizumab (4 cycles), gemcitabine (6 cycles), carboplatin (6 cycles), letrozole and abemaciclib	45	172

On Study Day 535, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Atezolizumab)	Causality (Ipatasertib)	Causality (Paclitaxel)
Retching	1	Non-serious	1	1	Unrelated	Unrelated	Unrelated
Pleural effusion	2	Non-serious	19	Unresolved	Unrelated	Unrelated	Unrelated
Chills	2	Non-serious	21	21	Unrelated	Unrelated	Unrelated
Nausea	1	Non-serious	21	21	Unrelated	Unrelated	Unrelated
Fatigue	1	Non-serious	23	Unresolved	Unrelated	Related	Related
Diarrhea	1	Non-serious	23	Unresolved	Unrelated	Related	Related

Study Number/CRTN:	CO40016/318263	Patient number	3004
Demographics:	63-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		

Cohort:	Cohort C
Event 1 (PT) Category:	Hyperglycemia Grade ≥ 3 hyperglycemia
Event 2 (PT) Category:	Lymphoedema SAE
Event 3 (PT) Category:	Urinary tract infection SAE
Event 4 (PT) Category:	Febrile neutropenia SAE
Event 5 (PT) Categories:	Pneumonitis SAE, Grade ≥ 2 pneumonitis

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative metastatic right breast cancer (T2N3M1) on Study Day −35.

At screening sites of disease involvement included right breast, right cervical neck, lymph node (right supraclavicular and right axillary and right cervical), right bone scapula and right supraclavicular lymph node.

No past cancer treatments are reported.

The patient′s medical history included tumor pain. Surgical history included left shoulder operation. Concurrent conditions included diabetes mellitus and hypertension.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included linagliptin/metformin, irbesartan, simvastatin, glimepiride, and amlodipine.

Event 1: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of atezolizumab was administered on Study Day 29, paclitaxel on Study Day 36 and ipatasertib (400 mg) on Study Day 42.

On Study Day 43, a laboratory work-up showed glucose 337 mg/dL and the patient was diagnosed with non-serious Grade 3 hyperglycemia. No treatment was reported for this event. On Study Day 49, the event of hyperglycemia was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**Glucose** (normal range: 70-100 mg/dL)
– 2	115
43	337
49	113

Due to the event of hyperglycemia, there was no change in the study treatment with paclitaxel. However, study treatment with atezolizumab wasinterrupted on Study Day 30 and next dose given on Study Day 56 and ipatasertib was interrupted on Study Day 43 and next dose was given on Study Day 50 at a reduced dose of 300 mg from 400 mg.

The Investigator considered hyperglycemia to be related to atezolizumab and ipatasertib and unrelated to paclitaxel.

Event 2: Lymphedema

Prior to the event of lymphedema, the most recent dose of atezolizumab was administered on Study Day 29, ipatasertib (400 mg) on Study Day 42. and paclitaxel on Study Day 43.

On Study Day 49, the patient presented due to edema in right arm after waking up. An angio CT-scan showed normal venous system but diffused upper extremity swelling. The patient was diagnosed with Grade 1 lymphedema in right arm, leading to hospitalization. The event occurred due to no position change during sleeping. She received treatment with ketorolac, *Vitis vinifera* seed and aceclofenac. On Study Day 51, the event of lymphedema was considered resolved and she was discharged from the hospital.

There was no change in the study treatment due to the event of lymphedema.

The Investigator considered lymphedema to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to other causes (no position change during sleeping).

Event 3: Urinary tract infection

Event 4: Febrile neutropenia

Event 5: Pneumonia

Prior to the events of urinary tract infection, febrile neutropenia and pneumonia, the most recent dose of atezolizumab was administered on Study Day 56, paclitaxel on Study Day 70 and ipatasertib (400 mg) on Study Day 73.

On Study Day 74, the patient′s experienced fever (body temperature was 38.4°C). A laboratory work-up showed WBC count 0.66 × $10^3/\mu L$ (normal range: 4-10 × $10^3/\mu L$), absolute neutrophil count 48% (normal range: 40-75%), absolute lymphocyte count 43.9% (normal range: 20-50%), and C-reactive protein 29.76 (normal range: 0-0.50 mg/dL). She was diagnosed with Grade 3 urinary tract infection (urinalysis not reported) and Grade 4 febrile neutropenia, leading to hospitalization. She received treatment with ciprofloxacin, cefepime, filgrastim and propacetamol. On Study Day 77, a CT-scan showed Grade 2 pneumonitis in both lungs. She received treatment with methylprednisolone, sulfamethoxazole/trimethoprim, codeine, levofloxacin and meropenem for pneumonitis. On Study Day 106, the events of urinary tract infection, pneumonitis and febrile neutropenia were considered resolved and she was discharged from the hospital.

Relevant laboratory values listed in the table below:

Study Day	**WBC count** (normal range: 4-10 × $10^3\mu L$)	**Neutrophils** (normal range: 40-75%)	**Lymphocytes** (normal range: 20-50%)	**Body temperature** (°C)
− 2	6.52	59.4	31.1	36.7
74	0.66	48	43.9	38.4
75	0.35	37.1	52.1	—
76	0.60	35	56.1	—
78	2.68	64.7	28.3	—
106	6.09	78.8	15.8	—

Due to the events of febrile neutropenia, urinary tract infection and pneumonitis, study treatment with atezolizumab was interrupted on Study Day 56, paclitaxel on Study Day 70 and ipatasertib on Study Day 73 and was later never resumed as per physician′s decision (see narrative below).

The Investigator considered febrile neutropenia and urinary tract infection to be unrelated to ipatasertib, atezolizumab and related to paclitaxel.

The Investigator considered pneumonitis to be and unrelated to ipatasertib, atezolizumab and related to atezolizumab and concurrent illness.

On Study Day 134, study treatment was permanently discontinued as per physician′s decision (the patient did not decide to discontinue the study treatment because of any one adverse event, but because of the judgement that the administration of the drug would jeopardize her in

the overall state of the subject) with the last dose atezolizumab administered on Study Day 58, paclitaxel on Study Day 70 and ipatasertib on Study Day 73. The patient then entered the long-term follow-up.

On Study Day 151, an overall response assessment showed disease progression.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Doxorubicin and cyclophosphamide	152	Ongoing

On Study Day 421, the patient was lost to follow-up.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	6	73	Related	Unrelated	Unrelated
Nausea	1	Non-serious	6	Unresolved	Unrelated	Unrelated	Related
Mucosal inflammation	1	Non-serious	15	22	Unrelated	Unrelated	Related
Neuropathy peripheral	1	Non-serious	36	Resolving	Unrelated	Unrelated	Related
Weight decreased	2	Non-serious	36	Resolving	Unrelated	Unrelated	Unrelated
Anemia	2	Non-serious	50	64	Unrelated	Unrelated	Related
Hyperglycemia	2	Non-serious	70	74	Related	Related	Unrelated

Platelet count decreased	3	Non-serious	78	83	Unrelated	Unrelated	Related

Study Number/CRTN:	CO40016/318264	Patient number	3007
Demographics:	63-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Cholecystitis SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER negative, PR positive, HER 2 negative, locally recurrent left breast cancer (T2NXMX) on Study Day -662.

On Study Day −64, the patient was diagnosed with metastatic disease with ER/PR negative, and HER2 negative in metastatic tissue. At screening sites of disease involvement included left lower lobe of lung and bilateral multiple lung metastasis.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide	-648	-585
Cancer therapy	Neoadjuvant	Paclitaxel	-564	-501
Surgery	Curative	Left breast lumpectomy	-462	NA
Radiotherapy	Adjuvant	Left breast (50 cGy, 19 fractions)	-69	-41

No medical or surgical history was reported. No concurrent condition was reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab. The same day, she also started loperamide prophylactically (total daily dose: 4 mg) for diarrhea.

Concomitant medication ongoing at Study Day 1 included aceclofenac.

Event: Cholecystitis

Prior to the event of cholecystitis, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 101 and ipatasertib (300 mg) on Study Day 104.

On Study Day 105, the patient experienced Grade 1 pyrexia (body temperature not reported; non-serious, unrelated). On the same day (Study Day 105), a laboratory work-up showed CRP 5.93 (units and normal range not reported). A blood culture revealed *Citrobacter freundii.* She received treatment with paracetamol and ciprofloxacin for the event of fever. On Study Day 107, the event of pyrexia was considered resolved. On the same day (Study Day 107), an abdomen and pelvic CT scan revealed Grade 1 (initial intensity) cholecystitis. There was no evidence of abdominal metastasis. On Study Day 112, her CRP was 1.32. On Study Day 127, the patient was hospitalized. On Study Day 128, a laparoscopic cholecystectomy was performed. Later, on the same day (Study Day 128), she experienced Grade 1 procedural pain (non-serious, unrelated). She received treatment with cefixime and cefazolin. On Study Day 129, the most extreme Grade for cholecystitis was assessed as Grade 3. Later the same day (Study Day 129), her CRP was 1.03, the event of cholecystitis was considered resolved and she was discharged from the hospital. On Study Day 139, the event of procedural pain was considered resolved.

Due to the event of cholecystitis, study treatment with ipatasertib, paclitaxel and atezolizumab was interrupted. The next dose of ipatasertib and paclitaxel was administered on Study Day 147, and atezolizumab on Study Day 154.

The Investigator considered cholecystitis, to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to other causes (unspecified).

On Study Day 283, radiographic response assessment showed disease progression. On the same day (Study Day 283), study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab administered on Study Day 270 and ipatasertib administered on Study Day 275. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	283	343
Cisplatin and gemcitabine	343	406
Resection of metastatic site in left lung	476	NA
Gemcitabine and carboplatin	497	Ongoing

On Study Day 865, the long-term follow-up was completed by study team.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Myalgia	1	Non-serious	8	45	Unrelated	Related	Unrelated

Study Number/CRTN:	CO40016/305145	Patient number	3008
Demographics:	46-year-old Black or African American female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		

Event 1 (PT) Category:	Pneumonitis Grade $\geq$ 2 pneumonitis
Event 2 (PT) Category:	Musculoskeletal chest pain SAE
Event 3 (PT) Category:	Cholecystitis SAE

The patient was randomized on Study Day -1.

The patient was diagnosed with ductal, moderately differentiated (Grade 2), ER/PR and HER 2 negative, metastatic right breast cancer (T4N3M1) on Study Day -103.

At screening, sites of disease involvement included breast (right breast mass), lymph node (right axillary, right lower paratracheal and multiple lymphadenopathy), liver (liver metastasis 1 right lobe segment 8, liver metastasis 2 right lobe segment 5/6 and multiple liver metastasis) and lung (malignant right pleural thickening and right lymphangitis carcinomatosis right lung).

No past cancer treatments were reported.

The patient′s medical history included aspiration pleural cavity and pulmonary embolism. Surgical history included caesarean section. Concurrent conditions included intracranial aneurysm, depression, epilepsy, and gastroesophageal reflux disease.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included omeprazole, tramadol, and morphine sulfate.

Event 1: Pneumonitis

Prior to the event of pneumonitis, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 43 and ipatasertib (400 mg) on Study Day 49.

On Study Day 62, the patient was diagnosed with non-serious Grade 2 pneumonitis (symptoms and diagnostic details not reported). No treatment was administered for the event of pneumonitis. The event of pneumonitis remained unresolved at the time of patient's death (see narrative below).

Due to the event of pneumonitis, there was no change in study treatment with paclitaxel, however, study treatment with ipatasertib and atezolizumab was interrupted and ipatasertib was

resumed at a reduced dose of 300 mg from 400 mg on Study Day 64, and atezolizumab was resumed on Study Day 85.

The Investigator considered pneumonitis, to be unrelated to paclitaxel and related to ipatasertib and atezolizumab.

Event 2: Musculoskeletal chest pain (Chest wall pain)

Prior to the event of musculoskeletal chest pain, the most recent dose of atezolizumab was administered on Study Day 43, paclitaxel on Study Day 64 and ipatasertib (300 mg) on Study Day 66.

On Study Day 67, the patient experienced serious Grade 3 musculoskeletal chest pain associated with breathlessness; however, denied fever. Subsequently, she was hospitalized. The blood tests results were unremarkable and did not suggest any infection. On Study Day 68, CT pulmonary angiogram excluded pulmonary embolus but showed worsening areas of consolidation in the lung and possible lytic lesions in sternum which were not there in the baseline scan. Treatment with tramadol and morphine sulfate was maintained for pain relief and she further received treatment with enoxaparin; following which her condition improved and she was feeling better. On Study Day 69, the event of musculoskeletal chest pain was considered resolved and she was discharged from the hospital.

There was no change in study treatment due to the event of musculoskeletal chest pain.

The Investigator considered musculoskeletal chest pain, to be unrelated to paclitaxel, ipatasertib and atezolizumab and related to disease under study.

On Study Day 104, radiographic response assessment showed disease with new lesions in bone (bilateral small volume bony deposits).

On Study Day 111, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab administered on Study Day 99 and ipatasertib administered on Study Day 105. The patient entered into the long-term follow-up.

Event 3: Cholecystitis

Prior to the event of cholecystitis, study treatment with paclitaxel, atezolizumab and ipatasertib was already discontinued.

On Study Day 116, the patient was feeling unwell, experienced overall weakness with right sided abdominal pain, constipation, and Grade 2 vomiting (non-serious, related to paclitaxel). Blood culture was performed (details not reported). She was suspected with cholecystitis. On Study Day 118, she was hospitalized. Vitals showed body temperature 37.7°C, heart rate 100 beats/min, respiration rate 20 breaths/min and oxygen saturation 99% on room air. She received treatment with dexamethasone, ondansetron, cyclizine, piperacillin/tazobactam,

docusate, hyoscine, oxycodone, and metoclopramide. On Study Day 119, the event of vomiting was considered resolved. On Study Day 120, an ultrasound showed multiple gallstones with normal kidneys, pancreas, and spleen. Thus, the diagnosis of Grade 3 cholecystitis was confirmed. The event of cholecystitis remained unresolved at the time of patient's death.

The Investigator considered cholecystitis, to be unrelated to paclitaxel, ipatasertib and atezolizumab and related to disease under study.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Gemcitabine and carboplatin	120	148
Epirubicin	169	169

On Study Day 207, the patient died due to disease progression. It was unknown whether an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**	**Causality (Atezolizumab)**

Study Number/CRTN:	CO40016/305639	Patient number	3009
Demographics:	60-year-old Black or African American female		

Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)
Cohort:	Cohort C
Event 1 (PT) Category:	Urinary tract infection SAE
Event 2 (PT) Category:	Dehydration SAE

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, ER negative, PR positive and HER 2 negative, right breast cancer (T4N2M0, histological grade unknown) on Study Day -822.

On Study Day −29, the patient was diagnosed with metastatic disease with ER/PR and HER 2 negative in metastatic tissue. At screening sites of disease involvement included breast (chest wall nodule).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide	-783	-743
Cancer therapy	Neoadjuvant	Docetaxel	-776	-652
Surgery	Curative	Left breast radical mastectomy	-597	NA
Radiotherapy	Neoadjuvant / adjuvant	Lymph node (supraclavicular), left breast and bone (left mid chest wall) (dose: 5000 cGy, 25 fractions)	-514	-479
Radiotherapy	Adjuvant	Bone (left chest wall boost) (dose: 1000 cGy, 5 fractions)	-481	-472
Radiotherapy	Adjuvant	Bone (left chest wall boost) (dose: 1000 cGy, 5 fractions)	-478	-472

The patient′s medical history included diverticulum. Surgical history included bilateral knee arthroplasty. Concurrent conditions included type 2 diabetes mellitus, hyperlipidemia, hypertension, osteoarthritis, peripheral motor neuropathy, lymphoedema (left arm and hand), pruritus (other, left chest wall itch), musculoskeletal chest pain (left chest wall pain) and cardiomegaly.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included furosemide, amlodipine, losartan, atorvastatin, carvedilol, hydrocodone bitartrate/paracetamol, sitagliptin phosphate, gabapentin, hydroxyzine, and potassium chloride.

On Study Day 28, the patient experienced Grade 2 dehydration (non-serious, unrelated). The patient received treatment with sodium chloride.

Event 1: Urinary tract infection
Event 2: Dehydration

Prior to the events of urinary tract infection and dehydration, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 42 and ipatasertib (300 mg) on Study Day 48.

On Study Day 49, the patient experienced Grade 2 abdominal pain (non-serious, related to ipatasertib), intractable Grade 2 nausea (non-serious. related to ipatasertib and paclitaxel) and vomiting attributed to chemotherapy with body temperature 36.7°C. A urinalysis showed 1+ bacteria, white blood cells 174 (normal range: 0-6, units not reported) and leukocyte esterase in large amount. The patient was diagnosed with serious Grade 3 urinary tract infection and Grade 3 worsening of dehydration, leading to hospitalization (for observation). On the same day (Study Day 49), she was also noted with acute kidney injury with creatinine:1.5 mg/dL (normal range: 0.52-1.21 mg/dL) and blood urea nitrogen: 25 mg/dL (normal range: 7-18 mg/dL). It was reported that acute kidney injury was attributed to dehydration which was considered due to nausea, vomiting, and poor oral intake. Relevant laboratory work-up throughout the events was not reported. She received treatment with ceftriaxone sodium, ondansetron, calcium chloride/potassium chloride/sodium lactate and sodium chloride; following which her diet was progressed from clear liquid to soft, which she was able to tolerate. On Study Day 52, her creatinine was 1.3 mg/dL and blood urea nitrogen 16 mg/dL. On the same day (Study Day 52), the event of abdominal pain was considered resolved. On Study Day 53, the event of nausea improved to Grade 1. On the same day (Study Day 53), the event of urinary tract infection and serious Grade 3 event of dehydration were considered resolved and she was discharged from the hospital. The event of nausea and non-serious Grade 2 event of dehydration remained unresolved at the time of patient′s death (see below).

Due to the events of urinary tract infection and dehydration (serious), study treatment with paclitaxel, ipatasertib and atezolizumab was interrupted and was the next dose was administered on Study Day 70.

The Investigator considered urinary tract infection and dehydration (serious), to be related to paclitaxel, ipatasertib and atezolizumab.

On Study Day 91, radiographic response assessment showed disease progression and the study treatment was permanently discontinued with the last dose of paclitaxel and atezolizumab administered on Study Day 85 and ipatasertib administered on Study Day 90. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Gemcitabine and carboplatin	93	190
Capecitabine	198	504
Sacituzumab govitecan	525	525

On Study Day 550, the patient died due to failed to thrive. Underlying cancer was not considered as contribution factor. It was unknown whether an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**	**Causality (Atezolizumab)**

Event 3 (PT) Category:	Hyperglycemia (Second episode) Grade ≥ 3 hyperglycemia		
Event 4 (PT) Categories:	Hyperglycemia (Third episode) AE leading to study treatment discontinuation, Grade ≥ 3 hyperglycemia		
Event 5 (PT) Categories:	Diabetic ketoacidosis		

	SAE, AE leading to study treatment discontinuation, Grade ≥ 3 hyperglycemia
Event 6 (PT) Category:	Hyperglycemia (Fourth episode) Grade ≥ 3 hyperglycemia
Event 7 (PT) Categories:	Hyperglycemia (Fifth episode) AE leading to study treatment discontinuation, Grade ≥ 3 hyperglycemia

The patient was randomized on Study Day − 2.

The patient was initially diagnosed with ductal, poorly differentiated, ER positive, PR negative and HER2 negative, left breast cancer (T2N1miMX) on Study Day −771 following left breast biopsy on the same day.

On Study Day −738, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative in metastatic tissue, following left sentinel node biopsy on the same day. On Study Day −38, the patient was diagnosed with locally recurrent disease. At screening sites of disease involvement included lymph nodes (left internal mammary lymph node, right level 1 right axillary lymph node, peritracheal node and right level 2 right axillary node).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Simple mastectomy of left breast and other surgery of left lymph node	-738	NA
Cancer therapy	Adjuvant	Anastrozole	-695	-35

The patient's medical history included neutrophil toxic granulation present. No surgical history was reported. Concurrent conditions included asthma, rhinitis allergic, dermatitis atopic, hyperlipidemia, osteoarthritis (bilateral knees), osteopenia, glucose tolerance impaired, urticaria, dyshidrotic eczema, hyperglycemia, lymphocyte count decreased, and monocyte count decreased.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included montelukast sodium, azelastine hydrochloride, salbutamol sulfate, fluticasone propionate/salmeterol xinafoate, olopatadine

hydrochloride, tiotropium bromide, beclomethasone dipropionate, cetirizine hydrochloride, calcium carbonate/cholecalciferol, fish oil and dexamethasone and loperamide.

Event 1: Rash maculo-papular

Prior to the event of rash maculo-papular, the most recent dose of paclitaxel was administered on Study Day 8, atezolizumab and ipatasertib (400 mg) on Study Day 15.

On Study Day 16, within 24 hours of end of atezolizumab infusion, the patient experienced non-serious Grade 2 (initial intensity) rash maculo-papular on chest which was considered as systemic infusion reaction. On Study Day 17, the rash spread to legs, arms, back and then on all over the body and was considered worsened to Grade 3. She received treatment with dexamethasone, prednisone, and hydroxyzine for the event of rash maculo-papular. On Study Day 20, the rash was only present on arms and the event improved Grade 2. On Study Day 22, the event of rash maculo-papular further improved to Grade 1. She further received treatment with triamcinolone. On Study Day 34, the event of rash maculo-papular was considered resolved.

Due to the event of rash maculo-papular, there was no change in study treatment with paclitaxel, however, study treatment with atezolizumab was interrupted on Study Day 29 and was resumed on Study Day 99, ipatasertib was interrupted on Study Day 32 and was resumed on Study Day 33.

The Investigator considered rash maculo-papular, to be related to ipatasertib and atezolizumab, and unrelated to paclitaxel.

Event 2: Hyperglycemia (First episode)

Prior to the event of hyperglycemia (first episode), the most recent dose of paclitaxel and atezolizumab was administered on Study Day 29, ipatasertib (400 mg) on Study Day 33.

On Study Day 34, a laboratory work-up showed fasting glucose: 319 mg/dL (normal range: 60-159 mg/dL), leading to diagnosis of non-serious Grade 3 hyperglycemia (first episode). Relevant laboratory work-up is reported in the table below. She received treatment with metformin, isophane insulin, insulin glargine and insulin lispro (details in the table below). On Study Day 41, the event of hyperglycemia improved to Grade 2.

Due to the event of hyperglycemia, study treatment with atezolizumab was interrupted on Study Day 29 and was resumed on Study Day 99, ipatasertib was reduced to 300 mg on Study Day 43, and paclitaxel was interrupted after Study Day 57 and was resumed on Study Day 78.

The Investigator considered hyperglycemia (first episode), to be unrelated to paclitaxel and related to ipatasertib, atezolizumab and other cause (unspecified).

Event 3: Hyperglycemia (Second episode)

Prior to the event of hyperglycemia (second episode), the most recent dose of atezolizumab was administered on Study Day 29, ipatasertib (400 mg) on Study Day 33 and paclitaxel on Study Day 36.

On Study Day 42, a laboratory work-up showed glucose: 196 mg/dL (normal range: 60-159 mg/dL) and potassium: 3.3 mEq/L (normal range: 3.5-5.3 mEq/L), leading to diagnosis of non-serious Grade 2 (initial intensity) hyperglycemia (second episode) and Grade 1 hypokalemia (non-serious, related to ipatasertib and atezolizumab). Relevant laboratory work-up is reported in the table below. Treatment with metformin, isophane insulin, insulin glargine and insulin lispro was maintained. On Study Day 55, the event of hyperglycemia (second episode) worsened to Grade 3. On Study Day 56, the event of hypokalemia was considered resolved.

There was no change in study treatment due to the event of hyperglycemia (second episode).

The Investigator considered hyperglycemia (second episode), to be unrelated to paclitaxel and related to ipatasertib and atezolizumab.

Event 4: Hyperglycemia (Third episode)
Event 5: Diabetic ketoacidosis
Event 6: Hyperglycemia (Fourth episode)
Event 7: Hyperglycemia (Fifth episode)

Prior to the event of hyperglycemia (third episode), the most recent dose of atezolizumab was administered on Study Day 29, paclitaxel on Study Day 43 and ipatasertib (300 mg) on Study Day 48.

On Study Day 56, in the afternoon, the patient′s laboratory work-up showed fasting glucose 347 mg/dL (normal range: 60-159 mg/dL) and HbA1c: 10.2 % (normal range: 4.6-6 %), leading to diagnosis of non-serious Grade 3 hyperglycemia (third episode) and Grade 1 glycosylated hemoglobin increased (non-serious, unrelated). Relevant laboratory work-up is reported in the table below. She received treatment with isophane insulin. On Study Day 57, the patient experienced Grade 2 vomiting (non-serious, related to paclitaxel and atezolizumab). No treatment was administered for the event of vomiting.

Prior to the events of diabetic ketoacidosis and hyperglycemia (fourth episode), the most recent dose of atezolizumab was administered on Study Day 29, ipatasertib (300 mg) on Study Day 48 and paclitaxel on Study Day 57.

On Study Day 58, a laboratory work-up showed blood glucose 730 mg/dL (normal range not reported), sodium 132 mEq/L (normal range: 133-145 mEq/L), potassium 3.7 mEq/L (normal range: 3.5-5.3 mEq/L), phosphorus 1.1 mg/dL (normal range: 2.7-4.5 mg/dL), magnesium

0.7 mg/dL (normal range: 1.7-2.3 mg/dL), creatinine: 0.23 μmol/L (normal range: 53-106 μmol/L). Arterial blood gas analysis showed pH 7.13. The patient was diagnosed with serious Grade 4 diabetic ketoacidosis along with Grade 3 dehydration (non-serious, related to paclitaxel), Grade 1 acute kidney injury (non-serious, unrelated), Grade 1 hyperkalemia, Grade 3 hypophosphatemia, Grade 3 hypomagnesemia (all non-serious, related to ipatasertib and atezolizumab), Grade 1 white blood cell count increased (non-serious, related to ipatasertib and paclitaxel, WBC count not reported), Grade 1 immature granulocyte count increased (non-serious, related to ipatasertib and paclitaxel, immature granulocyte count not reported). Subsequently, she was hospitalized (in ICU). Relevant laboratory work-up is reported in the table below. She received treatment with magnesium sulfate, calcium chloride/potassium chloride/sodium lactate, potassium chloride and glucose. On the same day (Study Day 58), the events of hypomagnesemia and hyperkalemia were considered resolved; however, she was noted with Grade 1 hypokalemia (non-serious, related to ipatasertib and atezolizumab). On Study Day 59, the events of vomiting, acute kidney injury, white blood cell count increased and immature granulocyte count increased were considered resolved. On Study Day 60, the event of dehydration was considered resolved. On Study Day 61, the events of diabetic ketoacidosis and hypokalemia were considered resolved and she was discharged from the hospital. On Study Day 63, the event of hypophosphatemia was considered resolved. On Study Day 69, the event of hyperglycemia (third episode) improved to Grade 2.

On Study Day 70, ongoing event of hyperglycemia (glucose 220 mg/dL) was reported as non-serious Grade 2 event. Relevant laboratory work-up is reported in the table below. Treatment with metformin, isophane insulin, insulin glargine and insulin lispro was maintained On an unspecified day, the event of hyperglycemia (fourth episode) worsened to Grade 3. On Study Day 76, the event of hyperglycemia (fourth episode) improved to Grade 1 and later was considered resolved on the same day (Study Day 76).

Prior to the event of hyperglycemia (fifth episode), the most recent dose of atezolizumab was administered on Study Day 29, ipatasertib (300 mg) on Study Day 48 and paclitaxel on Study Day 78.

On Study Day 84, the patient experienced blurred vision and neuropathy but without worsening. A laboratory work-up showed glucose 266 mg/dL (normal range: 60-159 mg/dL), leading to diagnosis of non-serious Grade 3 hyperglycemia (fifth episode). Relevant laboratory work-up is reported in the table below. On Study Day 85, she was also noted with Grade 2 type 1 diabetes mellitus (non-serious, related to ipatasertib and atezolizumab, laboratory work-up was not reported for this day). She received treatment with metformin, isophane insulin, insulin glargine and insulin lispro (details in the table below). On Study Day 91, the event of hyperglycemia (fifth episode) was considered resolved. The event of type 1 diabetes mellitus remained unresolved at the time of patient's death (see below).

The event of glycosylated hemoglobin increased remained unresolved at the time of patient's death (see narrative below).

Due to the event of hyperglycemia (third episode) and diabetic ketoacidosis paclitaxel was interrupted after Study Day 57 and was resumed on Study Day 78.

Due to event of hyperglycemia (fourth and fifth episode), there was no change in study treatment with paclitaxel.

Due to these events, treatment with atezolizumab was interrupted after Study Day 29 and was resumed on Study Day 99 and paclitaxel was interrupted after Study Day 57 and was resumed on Study Day 78.

Due to the events of hyperglycemia (third and fifth episode) and diabetic ketoacidosis, study treatment with ipatasertib was permanently discontinued with last dose administered on Study Day 48.

The Investigator considered hyperglycemia (third episode) and diabetic ketoacidosis, to be unrelated to paclitaxel and related to ipatasertib and atezolizumab.

The Investigator considered hyperglycemia (fourth episode), to be unrelated to paclitaxel and related to ipatasertib, atezolizumab and other cause (unspecified).

The Investigator considered hyperglycemia (fifth episode), to be unrelated to paclitaxel, ipatasertib and related to atezolizumab.

On Study Day 107, radiographic response assessment showed disease progression.

On Study Day 113, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab and paclitaxel administered on Study Day 99 and Study Day 106, respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day

Atezolizumab and paclitaxel	113	225
Capecitabine	247	341
Pegylated liposomal doxorubicin	366	394
Sacituzumab govitecan hziy	429	590
Eribulin	604	611
Doxorubicin and cyclophosphamide	625	646
Carboplatin and gemcitabine	667	737

On Study Day 780, the patient died due to disease progression. It was unknown whether an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305639	Patient number	3016
Demographics:	62-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Peripheral motor neuropathy AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Fatigue AE leading to study treatment discontinuation		
Event 4 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 5 (PT) Categories:	Cardiac arrest Deaths due to adverse event, SAE		

A narrative for this patient is available in Section 1.1 Narratives for patients who died due to an adverse event(s).

Study Number/CRTN:	CO40016/306603	Patient number	3024
Demographics:	49-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Gastroenteritis norovirus SAE		
Event 2 (PT) Category:	Aspartate aminotransferase increased Grade ≥3 hepatotoxicity		
Event 3 (PT) Category:	Diarrhea Grade ≥3 diarrhea		
Event 4 (PT) Category:	Pyrexia SAE		
Event 5 (PT) Category:	Hypertransaminasaemia SAE		
Event 6 (PT) Category:	Fatigue SAE		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER2 negative left breast cancer (T2N1M0) approximately 1 years and 9 months prior to study entry.

The patient was diagnosed with metastatic disease on Study Day − 36 with ER /PR negative and HER2 negative disease in metastatic tissue following left bed mastectomy. At screening, sites of disease involvement included lymph node (subcarinal) and left chest wall, left pleural effusion, anterior chest wall soft tissue thickening and bone (left 3rd costochondral junction and left frontal).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 1 years 9 months prior to study entry	Approximately 1 years 7 months prior to study entry
Cancer therapy	Neoadjuvant	Carboplatin and paclitaxel (6 cycles each)	Approximately 1 years 6 months prior to study entry	Approximately 1 years 6 months prior to study entry
Surgery	Curative	Left simple mastectomy	Approximately 1 years 5 months prior to study entry	—
Radiotherapy	Adjuvant	Left chest wall (dose: 5000 cGy; 25 fractions)	Approximately 1 years 3 months prior to study entry	Approximately 1 years 2 months prior to study entry
Cancer therapy	Adjuvant	Capecitabine (2 cycles)	Approximately 1 years 2 months prior to study entry	Approximately 1 years 1 months prior to study entry

The patient′s medical history included hypotension, cardiac murmur, endometriosis, and hypothyroidism. No surgical history was reported. Concurrent conditions included depression, post-traumatic stress disorder, hot flush, neuropathy peripheral, fatigue, chest pain, back pain, Ehlers Danlos syndrome, psychogenic seizure, presyncope, dehydration, anxiety, autonomic nervous system imbalance, progesterone decreased, attention deficit hyperactivity disorder, cognitive disorder and myoclonic dystonia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included cholecalciferol, methylphenidate, clonidine, quetiapine, bupropion, paracetamol, ibuprofen, gabapentin, and hydrocodone/paracetamol.

On Study Day 2, the patient experienced Grade 1 gastroesophageal reflux disease (event occurred within 24 hours after end of atezolizumab infusion) (non-serious, related). She received treatment with calcium carbonate, lansoprazole, rabeprazole and pantoprazole for gastroesophageal reflux disease. The event remained unresolved at the time of patient′s death (see narrative below).

Due to the event of Grade 1 neuropathy peripheral (non-serious, related), study treatment with paclitaxel was reduced from 80 mg/m^2 to 65 mg/m^2 on Study Day 85.

Event 1: Gastroenteritis norovirus (Norovirus gastroenteritis)

Event 2: Aspartate aminotransferase increased (Elevated AST)

Prior to the events of gastroenteritis norovirus and aspartate aminotransferase increased, the most recent dose of atezolizumab was administered on Study Day 141, paclitaxel on Study Day 148 and ipatasertib (400 mg) on Study Day 148.

On Study Day 146, the patient experienced Grade 2 diarrhea (non-serious, related). She received treatment with loperamide for diarrhea. On the following day (Study Day 147), the event of diarrhea was considered resolved.

On Study Day 149, the patient presented to the hospital with symptoms of nausea, vomiting, non-stop diarrhea (5 times) and Grade 1 pyrexia (body temperature: 101.4°F; non-serious, unrelated). A blood and urine cultures were without any growth. A stool pathogen panel was positive for norovirus, and she was diagnosed with Grade 3 gastroenteritis norovirus. Later, on the same day (Study Day 149), a laboratory work-up showed AST 466 U/L (normal range: 15-37 U/L) and she was diagnosed with non-serious Grade 3 aspartate aminotransferase increased and Grade 2 alanine aminotransferase increased (ALT not reported for this day; non-serious, unrelated). She received treatment with sodium chloride, cefepime and metronidazole for pyrexia. On the following day (Study Day 150), the patient was hospitalized. As per physician, the symptoms occurred due to event of gastroenteritis norovirus. She further received treatment with rabeprazole, sodium chloride, magnesium sulfate and pantoprazole. On Study Day 151, the events of gastroenteritis norovirus and pyrexia were considered resolved. On the following day (Study Day 152), the patient was discharged from the hospital. On Study Day 159, the events of aspartate aminotransferase increased, and alanine aminotransferase increased were considered resolved.

Grade changes for elevated AST are reported in the table below:

Event	Study Day	Grade change
Elevated AST	151	1
Elevated AST	152	2
Elevated AST	155	1

Relevant laboratory values listed in the table below:

Study Day	**WBC count** (normal range: 4.8-10.8 $\times$ $10^3/\mu L$)	**Absolute neutrophil count** (normal range: 1.5-6.5 $\times$ $10^3/\mu L$)	**Absolute lymphocyte count** (normal range: 1.2-3.4 $\times$ $10^3/\mu L$)
– 3	5.1	—	—
141	3.9	2.2	1.1
148	3.7	2.3	1.1

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 15-37 U/L)	**ALT** (normal range: 14-59 U/L)	**ALP** (normal range: 50-136 U/L)	**Total bilirubin** (normal range: 0.2-1 mg/dL)
-3	34	46	138	0.2
148	12	21	99	0.2
155	60	111	110	0.2

Due to the event of gastroenteritis norovirus, there was no change in study treatment with paclitaxel and atezolizumab; however, study treatment with ipatasertib was interrupted on Study Day 150 and next dose given on Study Day 153.

There was no change in the study treatment due to the event of aspartate aminotransferase increased.

The Investigator considered events of gastroenteritis norovirus and aspartate aminotransferase increased to be unrelated to paclitaxel, ipatasertib and atezolizumab and related to concurrent illness (unspecified).

Event 3: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 168, and ipatasertib (400 mg) on Study Day 171.

On Study Day 172, the patient experienced non-serious Grade 3 diarrhea (12 episodes). A stool sample for *Clostridium*. difficile, *Salmonella,* shigella, Shiga, *E*. coli, and Campylobacter was negative. She received treatment with loperamide. On the following day (Study Day 173), the event of diarrhea was considered resolved.

Loperamide details:

Indication	Loperamide daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	3
Diarrhea	2	PO	4	4
Diarrhea	4	PO	5	6
Diarrhea	4	PO	16	16
Diarrhea	4	PO	18	18
Diarrhea	2	PO	19	24
Diarrhea	4	PO	25	26
Diarrhea	2	PO	27	27
Diarrhea	2	PO	30	33
Diarrhea	2	PO	36	43
Diarrhea	8	PO	44	44
Diarrhea	2	PO	48	55
Diarrhea	2	PO	57	57
Diarrhea	2	PO	63	63
Diarrhea	2	PO	67	74
Diarrhea	6	PO	75	75
Diarrhea	2	PO	76	76
Diarrhea	6	PO	90	90
Diarrhea	2	PO	92	92
Diarrhea	6	PO	95	95
Diarrhea	2	PO	96	96
Diarrhea	6	PO	101	101
Diarrhea	2	PO	102	102
Diarrhea	4	PO	103	103
Diarrhea	2	PO	104	104
Diarrhea	4	PO	107	107
Diarrhea	6	PO	108	108
Diarrhea	4	PO	114	114
Diarrhea	4	PO	119	119
Diarrhea	2	PO	129	129
Diarrhea	2	PO	135	135
Diarrhea	2	PO	146	146
Diarrhea	8	PO	149	149

Indication	Loperamide daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	157	158
Diarrhea	8	PO	172	172
Diarrhea	4	PO	189	189

Due to the event of diarrhea, there was no change in study treatment with paclitaxel and atezolizumab; however, study treatment with ipatasertib was interrupted on Study Day 172 and further resumed at a reduced dose of 300 mg from 400 mg on Study Day 174.

The Investigator considered diarrhea to be related to paclitaxel, ipatasertib and atezolizumab.

On Study Day 210, the patient complaints of cough and shortness of breath. A chest X-ray revealed left pleural effusion and she received treatment with amoxicillin/clavulanic acid.

Event 4: Pyrexia (fever)

Event 5: Hypertransaminasaemia (transaminitis)

Prior to the events of pyrexia and hypertransaminasaemia, the most recent dose of ipatasertib (300 mg) was administered on Study Day 188, atezolizumab and paclitaxel on Study Day 210.

On Study Day 214, the patient completed her left sided thoracentesis is morning. Later, on the same day, the patient presented to the emergency department due to Grade 2 pyrexia (initial intensity Grade 1; body temperature 101.1°F). She received treatment with azithromycin for pyrexia.

On Study Day 216, at 11:55 hours, a laboratory work-up showed AST 110 U/L (normal range: 15-37 U/L). Later, at 22:21 hours, her AST worsened to 505 U/L (normal range: 15-37 U/L) and she was diagnosed with Grade 1 hypertransaminasaemia. Subsequently, she was hospitalized. During the hospitalization, she complaints of labored breathing and vitals showed body temperature 103.3°F. A COVID-19 test was not performed. A chest X-ray revealed left lower lobe opacification and effusion. The pleural fluid analysis was consistent with malignant effusion. She received treatment with paracetamol, piperacillin/tazobactam, lidocaine, and methylprednisolone. On Study Day 218, the event of pyrexia was considered resolved. On Study Day 220, the event of hypertransaminasaemia worsened to Grade 3. On Study Day 223, the patient was discharged from the hospital with prednisone for hypertransaminasaemia. On Study Day 225, the event of hypertransaminasaemia was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 15-37 U/L)	**ALT** (normal range: 14-59 U/L)	**ALP** (normal range: 50-136 U/L)	**Total bilirubin** (normal range: 0.2-1 mg/dL)
−3	34	46	138	0.2
210	19	23	103	0.3
216	110 505	—	—	—
217	640	571*	—	—
218	148	391*	—	—
220	11	158*	—	—
221	—	110*	—	—

*normal range: 13-56 U/L

Due to the events of pyrexia and hypertransaminasaemia, study treatment with ipatasertib was interrupted after Study Day 188, paclitaxel and atezolizumab was interrupted on Study Day 210 and never resumed due to disease progression (see narrative below).

The Investigator considered pyrexia to be unrelated to paclitaxel, ipatasertib and atezolizumab and related to disease under study.

The Investigator considered hypertransaminasaemia to be related to atezolizumab and unrelated to paclitaxel and ipatasertib.

On Study Day 224, a radiographic response assessment showed disease progression with new lesions in left lung (pleura).

Event 6: Fatigue

Prior to the event of fatigue, the most recent dose of ipatasertib (300 mg) was administered on Study Day 188, atezolizumab and paclitaxel on Study Day 210.

On Study Day 228, the patient presented to the emergency department with Grade 3 fatigue and weakness. On the following day (Study Day 229), the patient was hospitalized and to rule out sepsis. A chest CT-angiogram revealed consolidation in left lower lobe and chest X-ray

showed slight interval decrease in size of left pleural effusion. A laboratory work-up showed no abnormality. No treatment was reported for this event. On Study Day 230, the event of fatigue was considered resolved and she was discharged from the hospital.

Action taken with the study treatment was reported as not applicable.

The Investigator considered fatigue to be unrelated to atezolizumab, paclitaxel and ipatasertib and related to disease under study.

On Study Day 242, study treatment was permanently discontinued due to disease progression with the last dose of ipatasertib given on Study Day 188, atezolizumab and paclitaxel given on Study Day 210. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Ladiratuzumab (2 cycles)	243	278

On Study Day 435, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304331	Patient number	3029
Demographics:	63-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Tumor necrosis SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative advanced unresectable right breast cancer (T4N1M0) on Study Day – 49, followed by right breast biopsy performed on the same day.

At screening, sites of disease involvement included right breast, right axillary lymph node A, B and C.

No past cancer treatments are reported.

The patient′s medical history included appendicitis. Surgical history included appendicectomy and blood transfusion. Concurrent conditions included chronic tonsillitis, essential hypertension, hypertensive heart disease, cardiac failure, pancreatitis chronic, hemangioma of liver, liver disorder, pyelonephritis chronic, fibrocystic breast disease, diabetes mellitus, left ventricular hypertrophy, adrenal adenoma, cholecystitis chronic, ovarian cyst, uterine leiomyoma, spinal disorder, and aortic arteriosclerosis.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included hydrochlorothiazide/ramipril, trimetazidine and metformin.

Event: Tumor necrosis

Prior to the event of tumor necrosis, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 157 and ipatasertib (400 mg) on Study Day 163.

On Study Day 169, the patient′s weekly breast ultrasound scan showed growth formation which was heterogenic in structure with cyst formation. She was diagnosed with Grade 1 tumor necrosis. On Study Day 224, during a scheduled visit for biopsy procedure, a physical examination revealed hyperemic skin thinning of right breast; thus, the patient had high risk of right breast external opening formation. Subsequently, the event of tumor necrosis was assessed to have worsened to Grade 3, leading to hospitalization for surgery. On Study Day 227, a right sided mastectomy with lymph nodes dissection was performed and on Study Day 235themicroscopic study showed breast tissue with 9 cm defined formation, 300 mL reddish fluid emitting at resection and grey-yellow tissues on left side due to a lot of hemorrhages. It also revealed breast tissue with defined infiltrating Grade 3 ductal carcinoma, and therapeutical path morphosis I-II with negative tumor edge. It was reported that six lymph nodes were dissected and showed chronic lymphadenitis (KI-83%). The patient required daily dressings and observation; thus, her hospitalization was prolonged to abide all sanitary hygienic products (dressing) taking into consideration to complete the resection. On Study Day 249, the event of tumor necrosis was considered resolved and she was discharged from the hospital.

Due to this event, study treatment with atezolizumab, paclitaxel and ipatasertib was interrupted and never resumed (see narrative below).

The Investigator considered tumor necrosis to be related atezolizumab, paclitaxel, ipatasertib and disease under study.

Study treatment was permanently discontinued as during the surgery for tumor necrosis, all target lesions were resected, hence patient would no longer participate in the study. The last dose of paclitaxel and atezolizumab was given on Study Day 211 and ipatasertib on Study Day 217. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to the post-operative scar area	277	277

On Study Day 811, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/318721	Patient number	3030
Demographics:	71-year-old female (Race unknown)		

Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)
Cohort:	Cohort C
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea
Event 2 (PT) Categories:	Autoimmune hepatitis SAE, AE leading to Study treatment discontinuation

The patient was randomized on Study Day − 6.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, right breast cancer (T2N1M1) on Study Day − 57.

On Study Day − 36, ER/PR and HER2 negative disease was diagnosed in metastatic tissue. At screening sites of disease involvement included right lung (prevertebral right basal and nodule under pleural apical right), right breast (supero-external paramedian) and right lymph nodes (axillary and mediastinal lymph nodes).

No past cancer treatments were reported.

No medical or surgical history was reported. Concurrent conditions included osteoarthritis, back pain, dust allergy and seasonal allergy.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medication ongoing at Study Day 1 was reported.

On Study Day 2, the patient received loperamide prophylactically (total daily dose: 2 mg, PO) for diarrhea.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 7.

On Study Day 8, the patient experienced non-serious Grade 1 (initial intensity) diarrhea without general health disorder. No diagnostic test was performed. Unspecified rehydration was given and she received treatment with diosmectite and loperamide. Grade changes and loperamide

treatment details for the event of diarrhea are reported in the table below. On Study Day 149, the event of diarrhea was considered resolved.

Grade changes for diarrhea:

Study Day	Grade changes for diarrhea
15	2
43	1
46	2
47	3
50	1
57	3
64	1

Loperamide treatment details:

Diarrhea	4	PO	201	206
Diarrhea	4	PO	211	211

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea, to be related to ipatasertib, paclitaxel and atezolizumab.

Event 2: Autoimmune hepatitis

Prior to the event of autoimmune hepatitis, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 156 and ipatasertib (400 mg) on Study Day 159.

On Study Day 160, the patient experienced abdominal pain. A CT scan showed hypotonia of bile ducts, evoking angiocholitis. She was diagnosed with bile duct infection along with hepatic cytolysis, anicteric cholestasis, inflammatory syndrome and serious Grade 3 autoimmune hepatitis (laboratory work-up was not reported for this day). Subsequently, she was hospitalized and received treatment with ceftriaxone, metronidazole, prednisone, tramadol, corticosteroid (unspecified) and prednisolone metasulfobenzoate sodium. The inflammatory syndrome

reduced well with disappearance of the hyperleukocytosis. Relevant laboratory work-up is reported in the table below. On an unspecified day, CRP reduced to 24.4 mg/L (normal range not reported). Abdominal pain also decreased; however, she had tenderness in the right hypochondrium. On Study Day 166, she experienced a resurgence of fever (body temperature not reported) with the appearance of a biological inflammatory syndrome without any infectious syndrome. On Study Day 168, her laboratory work-up showed albumin: 29 g/L (normal range not reported). It was reported that cytolysis and cholestasis persisted and increased. On Study Day 170, a cholangio MRI was performed (details not reported). On Study Day 172, she was discharged from the hospital. On Study Day 357, the event of autoimmune hepatitis was considered resolved.

Due to the event of autoimmune hepatitis, study treatment with ipatasertib, paclitaxel and atezolizumab was permanently discontinued with last dose of atezolizumab administered on Study Day 156, paclitaxel on Study Day 219 and ipatasertib on Study Day 235. The patient entered into the long-term follow-up.

The Investigator considered autoimmune hepatitis, to be unrelated to ipatasertib, paclitaxel and related to atezolizumab.

On Study Day 423, a radiographic response assessment showed disease progression with new lesions in right side of brain (single cortical right parieto-temporo-occipital location measuring 24 × 13 mm with peripheral edema).

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to brain (stereotaxic) (dose: 33 cGy and 3 fractions)	457	462
Capecitabine	504	510
Pegylated liposomal doxorubicin hydrochloride	721	Ongoing

On Study Day 892, the patient was discontinued from the study as per Sponsor's and physician's decision.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304785	Patient number	3035
Demographics:	36-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Urinary tract infection SAE		

The patient was randomized on Study Day – 3.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T2N0M0) approximately 2 years and 3 months prior to study entry.

The patient was diagnosed with metastatic disease on Study Day – 41 with ER /PR and HER2 disease not reported in the metastatic tissue. At screening, sites of disease involvement included lymph node (midline subcarinal lymph node enlargement).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 2 years and 2 months prior to study entry	Approximately 2 years prior to study entry
Cancer therapy	Neoadjuvant	Paclitaxel (dose: 4 cycles)	Approximately 1 years and 11 months prior to study entry	Approximately 1 years and 9 months prior to study entry
Surgery	Curative	Left radical mastectomy	Approximately 1 years and 7 months prior to study entry	–
Radiotherapy	Adjuvant	Left breast (dose:5000 cGy)	Approximately 1 years and 3 months prior to study entry	Approximately 1 years and 2 months prior to study entry

No medical/surgical history was reported. The patient′s concurrent conditions included calculus urinary, factor V Leiden mutation and blood lactate dehydrogenase increased.

At screening, the patient′s ECOG Performance Status was 1.

At screening, urinalysis showed:

Study Day	**Urine pH** (normal range: 5-6; units not reported)	**Urine specific gravity** (normal range: 1.015-1.025; units not reported)	**Urine glucose**	**Urine protein**
− 24	6	1.020	0 (Absent)	+ 1 (Trace)

On Study Day 1, the patient received her first study treatment with ipatasertib, atezolizumab and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Urinary tract infection

Prior to the event of urinary tract infection, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 2.

On Study Day 3, the patient experienced fever (body temperature not reported for this day) and dysuria. A laboratory work-up showed leukocytes 16.100/mm^3, bands 161/mm^3 and neutrophils 13.556/mm^3. Urinalysis showed leukocytes 40 cells per microscopic field, RBC count 20 cells per microscopic field, hemoglobin (2 ±) and negative nitrite was reported. The patient was diagnosed with Grade 3 urinary tract infection, leading to hospitalization. The double J stent was removed. She received treatment with cefuroxime, ketoprofen and levofloxacin for urinary tract infection. On Study Day 5, the patient was discharged from the hospital. On Study Day 6, the event of urinary tract infection was improved to Grade 2. On Study Day 14, the event of urinary tract infection was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**WBC count** (normal range: 3600-11000/μL)	**Absolute neutrophil count** (normal range: 1500-7900/μL)	**Absolute lymphocyte count** (normal range: 1000-5500/μL)
− 24	9870	5073	3612
− 4	9220	5698	2701
8	9310	5437	2951
15	7960	4394	2850

There was no change in the study treatment due to the event of urinary tract infection.

The Investigator considered urinary tract infection to be unrelated to atezolizumab, paclitaxel and ipatasertib and related to other causes (unspecified).

On Study Day 138, a radiographic response assessment showed disease progression with new lesion in pancreas (expansive hypodense lesion in the topography of the pancreatic head), lymph node (left peripancreatic lymph node enlargement), brain (bilateral left and right cerebellar hemisphere), lymph node (left axillary lymph node enlargement and left cervical level and right mediastinal lymph node enlargement) and study treatment was permanently discontinued with the last dose of ipatasertib given on Study Day 113, atezolizumab and paclitaxel on Study Day 127 respectively. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Carboplatin and gemcitabine (single cycle each)	143	143

On Study Day 192, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/318813	Patient number	3046
Demographics:	49-year-old American Indian or Alaska Native female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Tumor fistulisation SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with unspecified, poorly differentiated ER/PR and HER 2 negative, right breast cancer (T4bN1M1) on Study Day -81.

At screening sites of disease involvement included lung (left major pulmonary nodule and bilateral pulmonary nodules), breast (right) and lymph node (right axillary).

No past cancer treatments were reported.

No medical or surgical history was reported. No concurrent condition was reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medication ongoing at Study Day 1 was reported.

Event: Tumor fistulisation (Left breast tumor fistulization)

Prior to the event of tumor fistulisation, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 43 and ipatasertib (400 mg) on Study Day 49.

On Study Day 54, the patient was noted with left breast tumor necrosis with fistulization towards the skin of the breast associated with the persistent drainage. She was diagnosed with Grade 1 (initial intensity) tumor fistulisation. No diagnostic test was performed. She received treatment with diclofenac. On an unspecified day, the event worsened to Grade 3. On Study Day 102, she was hospitalized. On the same day (Study Day 102), on-study palliative 'other' surgery of right breast was performed. On Study Day 104, the event of tumor fistulisation was considered resolved and she was discharged from the hospital.

There was no change in study treatment due to the event of tumor fistulisation.

The Investigator considered tumor fistulisation, to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to other cause (unspecified).

On Study Day 221, radiographic response assessment showed disease progression with new lesions in right lung (upper right lobe and right medial basal segment).

On Study Day 246, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab administered on Study Day 212 and ipatasertib administered on Study Day 218. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	290	321
Radiotherapy to brain (holocraneal) (dose: 3000 cGy and 10 fractions)	352	352
Carboplatin	387	387

On Study Day 394, the patient died due to COVID-19 infection. Underlying cancer was considered as contribution factor. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Demographics:	83-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Categories:	Diarrhea SAE, Grade $\geq$ 3 diarrhea		
Event 2 (PT) Category:	Gamma-glutamyl transferase increased Grade $\geq$ 3 hepatotoxicity		

Event 3 (PT) Category:	Nausea SAE
Event 4 (PT) Categories:	Pneumonitis SAE, AE leading to study treatment discontinuation, Grade ≥ 2 pneumonitis

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR and HER2 negative, metastatic left breast cancer (T3N1M1) on Study Day − 61.

At screening sites of disease involvement included mediastinum (left anterior mediastinum), lymph node (right supraclavicular, left axillary, midline mediastinal), lungs (right lobe of left lung, upper left lobe), liver (midline segment IVB, midline adjacent) and bone (sternum and bilateral costal bow).

No past cancer treatments were reported.

The patient′s medical history included neck pain, nausea, left breast pain and blood creatinine increased. No surgical history was reported. Concurrent conditions included hypertension, dyslipidemia, blood urea increased, and blood lactate dehydrogenase increased.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included acetylsalicylic acid/aluminum glycinate/magnesium carbonate, atenolol, chlortalidone, simvastatin, tramadol and metamizole sodium.

The patient received loperamide prophylactically (total daily dose: 4 mg, PO) for diarrhea from Study Day 1 to Study Day 7.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 9.

On Study Day 10, the patient experienced Grade 2 (initial intensity) intermittent diarrhea with low food intake. She received treatment with loperamide (details in the table below). It was reported that she experienced 6 episodes of diarrhea in a day without improvement despite the treatment. On Study Day 12, she experienced fever (body temperature 38°C). On the same day (Study Day 12), the event of diarrhea worsened to Grade 3 and she was hospitalized. A

laboratory work-up showed absolute neutrophil count: 1554 /μL (normal range: 1700-8000 /μL) and WBC count: 2230 /μL (normal range: 3500-10500 /μL); thus, febrile neutropenia was ruled out. She also received hydration therapy and further treatment with ciprofloxacin, butylscopolamine, dimenhydrinate, ondansetron and ranitidine. Later, her fever resolved. On Study Day 14, the event of diarrhea was considered resolved. On Study Day 15, she was discharged from the hospital.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	7
Diarrhea	2	PO	8	8
Diarrhea	16	PO	9	9
Diarrhea	22	PO	10	10
Diarrhea	24	PO	11	11

Diarrhea	18	PO	36	36
Diarrhea	10	PO	37	37
Diarrhea	18	PO	38	39
Diarrhea	12	PO	40	40
Diarrhea	18	PO	41	42
Diarrhea	16	PO	43	43
Diarrhea	18	PO	44	48
Diarrhea	2	PO	51	53

Due to the event of diarrhea, Cycle 1 Day 15 of atezolizumab and paclitaxel was delayed, ipatasertib was interrupted on Study Day 11. The next dose was given on Study Day 22.

The Investigator considered diarrhea, to be related to ipatasertib, and unrelated to paclitaxel and atezolizumab.

Event 2: Gamma-glutamyltransferase increased (Gamma GT increase)

Prior to the event of gamma-glutamyltransferase increased, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 22 and ipatasertib (300 mg) on Study Day 28.

On Study Day 29, the patient was noted with non-serious Grade 1 (initial intensity) gamma-glutamyltransferase increased. GGT value was not reported throughout the event.

On Study Day 31, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (details in the table above).

On Study Day 36, the patient was noted with Grade 2 lymphopenia (non-serious, related to ipatasertib). On Study Day 40, the event of lymphopenia worsened to Grade 3. No treatment was administered for the event of lymphopenia.

On Study Day 43, the event of gamma-glutamyltransferase increased worsened to Grade 3. No treatment was administered for the event of gamma-glutamyltransferase increased. The event of gamma-glutamyltransferase increased remained unresolved at the time of patient's death (see narrative below).

There was no change in study treatment due to the event of gamma-glutamyltransferase increased.

The Investigator considered gamma-glutamyltransferase increased, to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Relevant laboratory work-up:

Event 3: Nausea
Event 4: Pneumonitis

Prior to the event of nausea, the most recent dose of paclitaxel, atezolizumab and ipatasertib (200 mg) was administered on Study Day 43.

On Study Day 44, the patient experienced Grade 1 (initial intensity) nausea. On Study Day 45, the event of nausea worsened to Grade 2. On Study Day 49, the event of nausea worsened to Grade 3 along with low ingestion of food, and she was hospitalized. Physical examination revealed good general condition (flushed, hydrated, afebrile, and eupneic). She was well-informed to time and space oriented. Her ECOG score of 2. An echocardiography showed segmental contractility and preserved dimensions. She was on intermittent tachypnea venturi mask and received treatment with ondansetron, metamizole sodium, dexamethasone, ranitidine, vitamin B complex, dimenhydrinate/fructose/glucose/pyridoxine hydrochloride, bromopride, magnesium sulfate, potassium chloride and potassium phosphate dibasic/potassium phosphate monobasic for the event of nausea, following which her diet improved.

Prior to the event of pneumonitis, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 43 and ipatasertib (200 mg) on Study Day 49.

On Study Day 51, the event of nausea improved to Grade 2, however, she experienced Grade 3 asthenia (related). On the same day (Study Day 51), the patient's hospitalization was prolonged. She received treatment with normal saline; however due to venous hydration, she was congested and treatment with furosemide was started. On Study Day 53, she experienced dyspnea. In the afternoon, dyspnea worsened. She was moved to ICU and venturi mask was replaced with nasal catheter. A Chest X-ray and blood cultures were performed (details not reported). On Study Day 56, a chest CT showed several diffuse changes confirming pneumonitis (initial Grade 2 on study day 51 and most extreme Grade 3 on study day 53). She was continued under non-invasive oxygen ventilation. She further received treatment with methylprednisolone, piperacillin sodium/tazobactam sodium, fenoterol, ipratropium, hydrocortisone, infliximab, prednisone, sulfamethoxazole, trimethoprim, amiodarone and diltiazem. On Study Day 71, the events of nausea and pneumonitis were considered resolved and she was discharged from the hospital with naso-enteral tube for diet and medication.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 3500-10500/μL	**Neutrophil count** Normal range: 1700-8000/μL	**Lymphocyte count** Normal range: 900-2900/μL

69	15380	12150	1707

Due to the event of nausea, study treatment with was interrupted and due to the event of pneumonitis, study treatment with ipatasertib, paclitaxel and atezolizumab was permanently discontinued with last dose of paclitaxel and atezolizumab administered on Study Day 43 and ipatasertib on Study Day 49. The patient entered into long-term follow-up.

The Investigator considered nausea, to be related to ipatasertib, paclitaxel and atezolizumab.

The Investigator considered pneumonitis, to be unrelated to ipatasertib and paclitaxel and related to atezolizumab.

On Study Day 119, the patient was hospitalized due to Grade 3 emphysematous cystitis (serious, causality reported as NA, probably related previous hospitalization). A laboratory work-up showed leukocytes 9740 and creatinine 0.55 (units and normal ranges not reported). She received treatment with ceftriaxone, diltiazem, ranitidine, prednisone, mirtazapine, metoclopramide, butyl scopolamine, metamizole sodium, sodium picosulfate, codeine, morphine, amikacin, piperacillin/tazobactam and naloxone. On Study Day 123, a chest X-ray results were worsened compared to previous exam (done on Study Day 56) and she was diagnosed with Grade 2 (initial intensity) pneumonia (serious; causality reported as NA). On the same day (Study Day 123), laboratory work-up showed leukocytes 10220. On Study Day 125, leukocytes were 6730.

On Study Day 127, the patient died due to breast cancer and the event of pneumonia. An autopsy was not performed. The events of lymphopenia, diarrhea and emphysematous cystitis remained unresolved at the time of patient's death.

Other AEs experienced by the patient during the study:

Event 3 (PT) Category:	Fatigue SAE		
Event 4 (PT) Category:	Dehydration SAE		
Event 5 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, left breast cancer (T1N1M0) approximately 3 years and 6 months prior to study entry.

On Study Day -368, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative in metastatic tissue. At screening, sites of disease involvement included lung (right basal, right medial apex, right pleural effusion, right hilar node and right mediastinal) and brain (left frontal lobe).

Past cancer treatments are listed in the table below:

Type of treatment	**Therapy Setting/Intent**	**Treatments details**	**Start Day**	**Stop Day**
Surgery	Curative	Axillary Dissection of left breast	Approximately 3 years and 6 months prior to study entry	NA

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide, and paclitaxel	Approximately 3 years and 5 months prior to study entry	Approximately 2 years and 11 months prior to study entry
Radiotherapy	Adjuvant	Breast (Left breast; dose: 50 cGy and 25 fractions) (Supraclavicular; dose: 48 cGy and 25 fractions)	Approximately 2 years and 10 months prior to study entry	Approximately 2 years and 9 months prior to study entry
Radiotherapy	Metastatic	Lung (Right upper pulmonary lobe; dose: 48 cGy and 4 fractions)	-322	-313

No medical history was reported. The patient′s surgical history included hip arthroplasty and laparoscopy. Concurrent conditions included depression, hypercholesterolemia, osteoarthritis, endometriosis, hypertension, anxiety, and fatigue.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included atorvastatin, paracetamol, hydralazine, metoprolol, diazepam, ibuprofen, mirtazapine, and escitalopram.

The patient received loperamide prophylactically (total daily dose: 4 mg, PO) for diarrhea on Study Day 2.

Event 1: Diarrhea
Event 2: Febrile neutropenia

Prior to the events of diarrhea and febrile neutropenia, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 12.

On Study Day 13, the patient experienced Grade 3 diarrhea and was hospitalized for investigations and hydration. Up on examination she was noted with fever (temperature 38.1°C) and laboratory work-up showed neutrophil count 0.84×10^9/L (normal range: 1.8-7.7 $\times 10^9$/L). The patient was diagnosed with Grade 3 febrile neutropenia. Relevant laboratory work-up and vitals are reported in the table below. Stool and blood cultures were negative. She received treatment with codeine, potassium and magnesium for the event of diarrhea, ondansetron for nausea and piperacillin/tazobactam for febrile neutropenia. Later, her fever subsided, with no

source found. On Study Day 15, the event of febrile neutropenia was considered resolved. On Study Day 18, the event of diarrhea was considered resolved and she was discharged from the hospital.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4-11 $\times$ 10^9/L	**Neutrophil count** Normal range: 1.8-7.7 $\times$ 10^9/L	**Lymphocyte count** Normal range: 1-4 $\times$ 10^9/L	**Body temperature** °C
Screening	7.1	4.97	0.96	36.3
13	1.9	0.84	0.73	38.1
15	4.7	2.66	1.03	—

Due to the event of diarrhea, Cycle 1 Day 15 of paclitaxel and atezolizumab was not administered and the next dose was given on Study Day 30 (Cycle 2 Day 1). Treatment with ipatasertib was interrupted on Study Day 14 and was resumed on Study Day 29.

Due to the event of febrile neutropenia, there was no change in study treatment with paclitaxel, however, study treatment with ipatasertib was reduced to 300 mg on Study Day 29 and Cycle 1 Day 15 of atezolizumab was not administered and the next dose was given on Study Day 30.

The Investigator considered diarrhea, to be related to ipatasertib and atezolizumab, and unrelated to paclitaxel.

The Investigator considered febrile neutropenia, to be related to ipatasertib and paclitaxel, and unrelated to atezolizumab.

Event 3: Fatigue (Worsening fatigue)
Event 4: Dehydration

Prior to the events of fatigue and dehydration, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 13.

On Study Day 28, the patient experienced Grade 2 fatigue associated with Grade 2 dehydration, leading to hospitalization. Laboratory work-up was not clinically significant. No treatment was administered for the event of fatigue, and she received treatment with sodium chloride for dehydration. On Study Day 30, her laboratory work-up showed sodium: 141 mmol/L (normal range 135-145 mmol/L), potassium: 4.2 mmol/L (normal range: 3.5-5.2 mmol/L). On the same day (Study Day 30), the event of fatigue improved to Grade 1 and event of dehydration was considered resolved and she was discharged from the hospital. The event of fatigue remained unresolved at the time of patient’s death (see narrative below).

Due to the events of fatigue and dehydration, Cycle 2 Day 1 of paclitaxel and atezolizumab was delayed and the next dose was given on Study Day 30. Treatment with ipatasertib was interrupted on Study Day 30 and was resumed on Study Day 31.

The Investigator considered fatigue and dehydration, to be related to ipatasertib, paclitaxel and atezolizumab.

Event 5: Diarrhea (second episode)

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 30, paclitaxel on Study Day 36 and ipatasertib (300 mg) on Study Day 41.

On Study Day 42, the patient experienced non-serious Grade 3 diarrhea. Unspecified treatment was administered for the event of diarrhea. On Study Day 43, the event of diarrhea was considered resolved.

Due to the event of diarrhea, there was no change in study treatment with atezolizumab, however, study treatment with ipatasertib was interrupted on Study Day 43 and was resumed on Study Day 57 and paclitaxel was reduced to 65 mg/m^2 from 80 mg/m^2 on Study Day 57.

The Investigator considered diarrhea, to be related to ipatasertib and paclitaxel and unrelated to atezolizumab.

Loperamide treatment details:

Indication	**Total daily dose** (Units: mg)	**Route**	**Start day**	**Stop day**
Diarrhea	4	PO	2	2
Diarrhea	4	PO	3	6
Diarrhea	12	PO	7	8
Diarrhea	16	PO	9	12
Diarrhea	8	PO	31	36
Diarrhea	4	PO	38	39
Diarrhea	4	PO	58	59
Diarrhea	4	PO	67	70
Diarrhea	4	PO	73	73
Diarrhea	10	PO	75	75
Diarrhea	6	PO	76	77
Diarrhea	4	PO	86	90
Diarrhea	6	PO	91	91
Diarrhea	4	PO	93	95
Diarrhea	8	PO	96	96

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	97	100
Diarrhea	2	PO	103	105
Diarrhea	4	PO	114	117
Diarrhea	8	PO	118	118

On Study Day 114, a radiographic response assessment showed disease progression with new lesions in brain (right frontal lobe).

On Study Day 148, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab administered on Study Day 113 and ipatasertib on Study Day 118. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to brain (bilatetal frontal and occipital lobes, left temporal lobe,) (dose: 120 cGy and 1 fraction)	142	142
Radiotherapy to brain (hippocampal sparing) (dose: 30 cGy and 10 fractions)	224	235
Vinorelbine	379	386
Carboplatin and Gemcitabine	414	Ongoing

On Study Day 543, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304331	Patient number	3054
Demographics:	59-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Tumor necrosis SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with “other” moderately differentiated, ER/PR and HER2 negative, locally advanced unresectable left breast cancer (T4N1M0) on Study Day − 90 following left breast biopsy on the same day.

At screening sites of disease involvement included breast (formation in left breast, lesion in left breast upper outer quadrant and lesion in left breast lower outer quadrant), soft tissue (skin fold) and lymph nodes (axillary lymph node left side A and axillary lymph node left side B).

No past cancer treatments were reported.

The patient’s medical history included Grade 1 cervical polyp. Surgical history included polypectomy. Concurrent conditions included Grade 1 pericarditis, Grade 1 hepatic cyst, Grade 1 renal cyst, Grade 1 uterine leiomyoma, Grade 1 spinal meningeal cyst, Grade 1 goiter, Grade 1 autonomic nervous system imbalance, Grade 1 metabolic cardiomyopathy and fibroma of head soft tissue.

At screening, the patient’s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included quercetin, metoprolol and temgicoluril.

Event: Tumor necrosis

Prior to the event of tumor necrosis, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 212 and ipatasertib (400 mg) on Study Day 217.

On Study Day 224, the patient was diagnosed with Grade 2 (initial intensity) tumor necrosis (symptoms and diagnostic details not reported for this day). No treatment was administered for the event.

On Study Day 279, a CT scan showed stable response but she experienced worsening of pain syndrome in left breast which was radiating to left axillary area and had bursting sensation and itching. On Study Day 292, a physical examination showed deformed left breast with 7 cm conglomeration observed in lower quadrant, 1 cm ulceration in lower edge which was nodular non-uniform, tightly merged to front chest wall, with sero-hemorrhagic discharge. On the same day (Study Day 292), the event of tumor necrosis became serious, and she was hospitalized.

On Study Day 295, palliative mastectomy with thoracic muscles of left breast and palliative left lymph node resection were performed. On Study Day 303, a macroscopic observation showed $6 \times 4 \times 7$ cm formation in breast tissue. A microscopic examination showed defined infiltrating in-breast tissue carcinoma and Grade 2 therapeutical pathomorphosis. Tumor edge was negative. It was reported that 12 lymph nodes were dissected, all lymph nodes were negative. On Study Day 307, immune-histochemistry revealed ER/PR negative and KI 35%. The patient required daily dressings and observation; thus, hospitalization was prolonged to abide all sanitary and hygienic procedure (dressings) in consideration of the complete resection. On Study Day 314, the event of tumor necrosis was considered resolved and she was discharged from the hospital.

Due to the event of tumor necrosis, study treatment with atezolizumab and paclitaxel was interrupted on Study Day 268 and ipatasertib was interrupted on Study Day 254 and was later never resumed (see narrative below).

The Investigator considered tumor necrosis, to be related to ipatasertib, paclitaxel and atezolizumab.

On Study Day 314, study treatment was permanently discontinued due to other reason (all target lesions were resected during the surgery thus the patient no longer participant in the study) with last dose of paclitaxel and atezolizumab administered on Study Day 268 and ipatasertib on Study Day 254. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to left cervical supraclavicular, axillary, parasternal lymph nodes and front chest wall left side (dose: 5000 cGy, fractions not reported)	351	393

On Study Day 753, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304784	Patient number	3055
Demographics:	45-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Pleural effusion SAE		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with unspecified, well differentiate, ER/PR and HER2 negative, left breast cancer (T4bN0M0) approximately 5 years prior to study entry.

On Study Day -37, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative in metastatic tissue. At screening sites of disease involvement included pleura (other right lower lobe pleura nodule), lung (nodule in apical region in the right lobe lung and nodule in the anterior region in the right lobe lung and bilateral sparse nodules in the lungs), liver (hepatic nodule in the right lobe vii region, hepatic nodule in the right lobe vii/vi region and sparse nodules in the liver parenchyma), bone (osteolytic lesion on right costal arch), kidney (lump on the anterior aspect of the left kidney), lymph nodes (right thoracic region, gastro-hepatic and right renal) and right pleural effusion.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide	Approximately 5 years prior to study entry	Approximately 5 years prior to study entry
Surgery	Curative	Simple mastectomy of left breast	Approximately 4 years and 10 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide, and paclitaxel	Approximately 4 years and 9 months prior to study entry	Approximately 4 years and 6 months prior to study entry
Radiotherapy	Adjuvant	Breast (left breast and left supraclavicular fossa; dose: 5040 cGy and 28 fractions)	Approximately 4 years and 4 months prior to study entry	Approximately 4 years and 2 months prior to study entry

The patient′s medical history included aspartate aminotransferase increased and alanine aminotransferase increased. No surgical history was reported. No concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medication ongoing at Study Day 1 was reported.

Event: Pleural effusion (Worsening of pleural effusion)

Prior to the event of pleural effusion, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 23, the patient experienced Grade 1 intermittent and non-productive cough (non-serious, unrelated). Upon auscultation vesicular murmur were decreased. A chest X-ray showed Grade 1 (initial intensity) right pleural effusion (worsening of non-target lesion). No treatment was administered for the event. On Study Day 29, the event of pleural effusion worsened to Grade 3 and she was hospitalized. On Study Day 30, a thoracentesis was performed with drainage of 2 liters of serous fluid. On Study Day 33, pleurodesis was performed. On Study Day 36, the chest drain removed. On the same day (Study Day 36), the event of pleural effusion was considered resolved and she was discharged from the hospital.

There was no change in study treatment due to the event of pleural effusion.

The Investigator considered pleural effusion, to be unrelated to ipatasertib, paclitaxel and atezolizumab, and related to disease under study.

On Study Day 57, a radiographic response assessment showed disease progression with new lesions in lymph node (right retropectoral lymph nodes), lung (compressive atelectasis of part of the right lower lobe) and right adrenal gland (nodular thickening).

On Study Day 64, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab administered on Study Day 57 and ipatasertib on Study Day 64. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Gemcitabine	98	158
Capecitabine and zoledronic acid monohydrate	189	Ongoing

On Study Day 446, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**	**Causality (Atezolizumab)**
Diarrhea	2	Non-serious	4	23	Related	Related	Unrelated
Nausea	1	Non-serious	4	30	Related	Related	Unrelated
Vomiting	1	Non-serious	4	4	Related	Related	Unrelated
Pain	1	Non-serious	6	Resolving	Unrelated	Related	Unrelated
Dermatitis allergic	1	Non-serious	14	17	Unrelated	Related	Unrelated

Study Number/CRTN:	CO40016/305113	Patient number	3060
Demographics:	44-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Influenza SAE		
Event 2 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day – 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T2N3M0), approximately 2 years prior to study entry.

The patient was diagnosed with metastatic disease on an unknown date with ER /PR and HER2 negative in metastatic tissue. At screening, sites of disease involvement included left breast (axilla lesion).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Docetaxel, fluorouracil, epirubicin and cyclophosphamide (unknown dose)	Approximately 1 years and 10 months prior to study entry	Approximately 1 years and 4 months prior to study entry
Surgery	Curative	Left lymph node (axillary dissection)	Approximately 1 years 5 months prior to study entry	–
Radiotherapy	Adjuvant	Left breast and supraclavicular fossa (unknown dose)	Approximately 1 years and 4 months prior to study entry	Approximately 1 years and 4 months prior to study entry

No medical/surgical history was reported. The patient′s concurrent conditions included pain in extremity (left arm).

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included calcium carbonate, paracetamol, and ibuprofen.

Event: Influenza

Prior to the event of influenza, the most recent dose of atezolizumab was administered on Study Day 55, paclitaxel on Study Day 62 and ipatasertib (400 mg) on Study Day 65.

On Study Day 66, the patient presented to the department with flue and high body temperature of 39°C. A blood test was performed, and results showed no neutropenia. She was diagnosed with Grade 2 influenza, leading to hospitalization. She received treatment with oseltamivir for influenza. On the following day (Study Day 67), the patient was discharged from the hospital. On Study Day 92, the event of influenza was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**WBC count** (normal range: 4-10 $\times$ 10^9/L)	**Absolute neutrophil count** (normal range: 2-7 $\times$ 10^9/L)	**Absolute lymphocyte count** (normal range: 1-3 $\times$ 10^9/L)	**Body temperature** (°C)
– 14	9.6	7.3	1.52	36.8
62	5.1	3.23	1.4	36.7
92	7.7	4.96	1.9	37

Due to this event, Cycle 3 Day 8 of paclitaxel was delayed and was given on Study Day 62, Cycle 3 Day 15 of atezolizumab was not administered. Treatment with ipatasertib was interrupted on Study Day 66. The next dose of atezolizumab and ipatasertib was given on Study Day 85.

The Investigator considered influenza to be unrelated to atezolizumab, paclitaxel and ipatasertib and related to other causes (unspecified).

Event 2: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 393, paclitaxel on Study Day 400, and ipatasertib (400 mg) on Study Day 404.

On Study Day 405, the patient experienced non-serious Grade 3 diarrhea. It was reported that she was going hourly but then received treatment with loperamide which settled her diarrhea. On Study Day 407, the event of diarrhea improved to Grade 1 and remained unresolved at the time of study discontiunation.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	1	Ongoing
Diarrhea	2	PO	405	407

There was no change in the study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to atezolizumab and paclitaxel and unrelated to ipatasertib.

On Study Day 673, a radiographic response assessment showed disease progression with new lesion in left breast (pec major).

On Study Day 722, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab given on Study Day 708, paclitaxel on Study Day 715 and ipatasertib on Study Day 721. The patient entered into the long-term follow-up.

On Study Day 750, the patient was discontinued from the study as study was terminated as per physician decision (LTFU terminated by the Sponsor).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Diarrhea	1	Non-serious	1	100	Related	Unrelated	Unrelated

Study Number/CRTN:	CO40016/318721	Patient number	3067
Demographics:	58-year-old female (Unknown race)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle)+Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Rash pruritic Grade ≥ 3 rash		
Event 2 (PT) Category:	General physical health deterioration SAE		
Event 3 (PT) Categories:	Covid-19 SAE, COVID-19 SAE		

The patient was randomized on Study Day − 11.

The patient was initially diagnosed with other histology, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T4N3M0), on Study Day − 57.

The patient was diagnosed with metastatic disease on an unknown day with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included formation in left breast (underlying mass with cutaneous infiltrate, and multiple retro-pectoral and supraclavicular axillary adenomegalies).

No past cancer treatments were reported.

The patient′s medical history included post procedural inflammation. No surgical history was reported. Concurrent conditions included drug hypersensitivity (penicillin), hypercholesterolemia, hypertension, deafness, hypothyroidism, and skin cancer (left breast).

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included levothyroxine, pristinamycin, ibuprofen, bisoprolol/hydrochlorothiazide, and spironolactone.

Event 1: Rash pruritic (skin rash all over the body, itchy)

Prior to the event of rash pruritic, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 7 and ipatasertib (400 mg) on Study Day 12.

On Study Day 13, she developed Grade 3 itchy rash pruritic all over body covering 80% of the body surface. It was reported that her tolerance to treatment was poor thus skin rash was considered related to hives and study treatment administration. Her body temperature was 39.1°C. She received treatment with desloratadine and corticosteroid (unspecified). Re-assessment was performed post 48 hours of treatment and advised to increase the treatment dose from 1 mg/kg to 2 mg/kg. On Study Day 43, the event of rash pruritic was considered resolved.

Due to the event of rash pruritic, Cycle 1 Day 15 of atezolizumab and paclitaxel was not administered, and the next dose was given on Study Day 36. Study treatment with ipatasertib was interrupted on Study Day 14 and the next dose was given on Study Day 38.

The Investigator considered rash pruritic to be unrelated to paclitaxel and related to atezolizumab and ipatasertib.

On Study Day 70, the patient was noted with Grade 3 anemia (initial intensity Grade 2; non-serious, unrelated). On Study Day 105, she was noted with Grade 3 hypokalemia (non-serious, unrelated) (potassium level not reported for this day). On the following day (Study Day 106), she was diagnosed with Grade 2 acute kidney injury (non-serious, unrelated; lab work-up not reported for this day). On Study Day 127, the event of acute kidney injury was considered resolved.

Event 2: General physical health deterioration (deterioration in general condition)

Prior to the event of general physical health deterioration, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 131 and ipatasertib (400 mg) on Study Day 98.

On Study Day 144, the patient was noted with Grade 3 general physical health deterioration associated with nausea, asthenia, hypotension without tachycardia, fever (vitals not reported) and mottling with no desaturation, oozing left breast, permeation nodules on left breast level associated with purulent and foul-smelling discharge, sacrum pressure ulcers, and bilateral lower limb edema. Laboratory work-up showed hypokalemia (potassium level not reported for this day), hyponatremia, acute renal failure, and inflammatory syndrome (lab work-up not reported). Subsequently, she was hospitalized. She received right heel dressings for pressure sores and oozing left breast and treatment with potassium chloride, glucose/potassium chloride/sodium chloride (to repair breast dressing which was very smelly and oozing), levothyroxine, paracetamol, and morphine. The pressure ulcer in sacrum and right heel was treated with biatain, 1 L bionolyte 5% per 24 hours. She further received treatment with tinzaparin. On Study Day 146, a laboratory work-up showed serum creatinine of 115 μmol/L (normal range not reported) and stable C-reactive protein: 80 (units and normal range not reported). She received continued hydration with 2 g of potassium in 1 L of bionylte, treatment with magnesium chloride, fentanyl, ketamine, metoclopramide, and midazolam administered over 15 minutes. An improvement was noted in phlebitis pain and in lower limb edema. On Study Day 153, her vitals improved with no fever and nausea. She then received treatment with glucose 1-phosphate disodium. During hospitalization, the patient complained of mild pain without dyspnea. Upon examination, she was oriented (GCS: 15), non-confused with no sensory motor deficit, no meningeal and cerebellar syndrome. The examination showed two ulcerative necrotic lesions covered with hyperalgic fibrin on skin with one extension of the nipple of about 12 cm in diameter and 5 cm deep and other 10 cm in diameter in axillary extension connected to the subcutaneous fistula and 2nd orifice more internal less than 2 cm in diameter. It was reported that, pain on visual analogue scale was 2/10 outside treatment and 8/10 while dressing the left breast wound. She further received treatment with oxycodone (20 mg continuous dose everyday) along with 10 mg bolus with a refractory period of 1 hour and increased dosing to 30 mg maximum per day. On an unspecified day, the event of general physical health deterioration improved. On Study Day 151, the event of hypokalemia was considered resolved. The event of general physical health deterioration was considered resolving at the time of patient's death (see narrative below).

Due to the event of general physical health deterioration, Cycle 6 Day 1 of atezolizumab and paclitaxel was delayed, and the next dose was given on Study Day 152 and treatment with ipatasertib was interrupted on Study Day 98 and later never resumed due to due non-compliance to study drug.

The Investigator considered general physical health deterioration to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to disease under study.

Treatment with ipatasertib was permanently discontinued due to non-compliance to study drug with the last dose given on Study Day 98.

Event 3: COVID-19 (COVID 19 infection)

Prior to the event of COVID-19, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 152.

On Study Day 154, during the ongoing hospitalization, her vitals showed blood pressure 140/80 mmHg, heart rate 100 bpm and oxygen saturation of 95% ambient air. She had no fever. A PCR test was performed, and the patient was diagnosed with Grade 3 moderate but typical COVID-19 with frosted glass opacities (without crazy paving crosslinks) and appearance of subpleural topography especially in the basal segment of upper right lobe and in the middle lobe with no condensations on radiography examination. She received treatment with ceftriaxone, macrogol and oxycodone. On Study Day 173, a follow-up chest CT-scan showed a clear improvement in the ground glass areas and the disappearance of bilateral pleural effusion thus, the event of COVID-19 was considered resolved. On the following day (Study Day 174), she was discharged from the hospital. On Study Day 179, the test for COVID-19 was reported negative.

Vitals reported in the table below:

Study Day	Body temperature (°C)	Pulse rate (beats per minute)	Respiratory rate (breaths per minute)	Blood pressure
− 23	37.9	62	16	134/77
152 (14:00 hours)	37.5	80	16	120/75
152 (18:15 hours)	37.7	87	16	138/91
152(19:50 h ours)	37.7	92	16	137/92

Relevant laboratory work-up reported in the table below:

Study Day	**WBC count** (normal range: 3.8-11 $\times$ 10^9/L)	**Absolute neutrophil count** (normal range: 1500-7500/μL)	**Absolute lymphocyte count** (normal range: 1000-4800/μL)
-6	7200*	5285	958**
152	3.16	2594	259
165	2.21	1019	356
167	4.73	3027	544

*normal range: 4000-11000/μL, **normal range: 1500-7500/μL

Due to the event of COVID-19, Cycle 7 Day 1 of paclitaxel and atezolizumab was delayed on Study Day 152 and next dose was given on Study Day 180.

The Investigator considered COVID-19 to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to disease under study.

On Study Day 183, an overall response assessment showed disease progression.

On Study Day 195, the study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab given on Study Day 180 and paclitaxel on the Study Day 195. The patient then entered the long-term follow-up phase.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Paclitaxel (3 cycles)	209	222

On Study Day 304, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Back pain	2	Non-serious	7	Unresolved	Unrelated	Unrelated	Unrelated
Diarrhea	2	Non-serious	11	120	Related	Related	Related
Decreased appetite	3	Non-serious	15	Unresolved	Unrelated	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304787	Patient number	3077
Demographics:	64-year-old Black or African American female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Categories:	Large intestine perforation SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, locally advanced unresectable right breast cancer (T3N2M0) on Study Day −63.

At screening sites of disease involvement included breast (upper lateral quadrant and left skin thickening) and lymph nodes (left axillary).

No past cancer treatments were reported.

No medical or surgical history was reported. No concurrent condition was reported.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medication ongoing at Study Day 1 included morphine.

Event: Large intestine perforation (Perforation in the sigmoid)

Prior to the event of large intestine perforation, the most recent dose of atezolizumab, paclitaxel and ipatasertib (400 mg) was administered on Study Day 31.

On Study Day 35, the patient experienced Grade 2 abdominal pain. Symptomatic treatment was administered with metamizole, tramadol, ranitidine, bromopride and ondansetron. On Study Day 39, abdomen CT scan revealed pneumoperitoneum and urgent surgery was recommended. On Study Day 40, the patient was stable and had improvement in abdominal pain. She was admitted to the hospital and underwent abdominal rectosigmoidectomy and terminal colostomy without complication. She received treatment with cefazolin and metronidazole. An anatomopathological examination concluded Grade 3 large intestine perforation and transmural inflammatory process. She further received treatment with ciprofloxacin. On Study Day 45, she was discharged from the hospital in a stable condition. On Study Day 49, she was stable without complications. On Study Day 59, she was well and without complications and her routine laboratory work-up showed not clinically significant changes. On the same day (Study Day 59), the event of large intestine perforation was considered resolved.

Due to the event of large intestine perforation, study treatment with ipatasertib, paclitaxel and atezolizumab was permanently discontinued with last dose of atezolizumab, paclitaxel and ipatasertib administered on Study Day 31. The patient entered into long-term follow-up.

The Investigator considered large intestine perforation, to be related to ipatasertib and atezolizumab and unrelated to paclitaxel.

On Study Day 133, a radiographic response assessment showed disease progression with new lesions in lymph nodes (upper mediastinum).

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Paclitaxel, cisplatin and gemcitabine	95	350
'Other' palliative surgery of left breast	226	NA
Cisplatin and gemcitabine	257	Ongoing

On Study Day 606, the patient died due to 'other' cause (companion was unable to inform). It was unknown if underlying cancer was a contribution factor or not. An autopsy was not performed.

Other AE experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Pruritus	1	Non-serious	13	13	Related	Related	Related

Study Number/CRTN:	CO40016/304891	Patient number	3080
Demographics:	49-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Categories:	Pneumonia SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, metastatic right breast cancer (T4N2M1) on Study Day − 58.

At screening, sites of disease involvement included lymph nodes (right axillary node, bilateral mediastinal node, and bilateral nodal metastases), lung (left lower pulmonary lobe, right upper pulmonary lobe and multiple bilateral) and breast (right).

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Metastatic	Right breast (dose: 2000 cGy, 5 fractions)	-31	-27

No medical or surgical history was reported. No concurrent condition was reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medication ongoing at Study Day 1 included loperamide.

Event: Pneumonia

Prior to the event of pneumonia, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 11.

On Study Day 12, the patient was hospitalized due to Grade 2 pneumonia (presenting signs, symptoms and confirmatory assessment details not reported). A chest X-ray was normal. Relevant laboratory work-up is reported in the table below. She received treatment with meropenem and acyclovir. On Study Day 15, a chest X-ray was performed (results not reported). On Study Day 16, CT head showed no brain metastasis. On Study Day 23, MRI head showed no evidence of meningoencephalitis. On Study Day 26, a chest X-ray showed suspicion for infection. On Study Day 34, she was discharged from the hospital. On Study Day 35, the patient was noted with breathlessness and dehydration and was re-hospitalized. On the same day (Study Day 35), a chest X-ray showed persisting infiltration throughout both lungs. She received further treatment with flucloxacillin, gentamicin, piperacillin sodium/tazobactam sodium, sodium chloride, folic acid, omeprazole, amoxicillin, ciprofloxacin, ibuprofen, codeine phosphate, morphine sulfate and prednisolone. On Study Day 36, a chest X-ray and CT chest abdomen and pelvis showed pneumonitis and disease progression in breast and lungs (non-target lesions). On Study Day 37, unspecified laboratory work-up was performed (results not reported). On Study Day 44, the event of pneumonia was considered resolved and she was discharged from the hospital.

Due to the event of pneumonia, there was no change in study treatment with ipatasertib, however, study treatment with atezolizumab and paclitaxel was permanently discontinued with last dose administered on Study Day 1 and Study Day 8, respectively.

The Investigator considered pneumonia, to be unrelated to ipatasertib, paclitaxel, and atezolizumab and related to disease under study and concurrent illness (unspecified).

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4-10 $\times$ 10^9/L	**Neutrophils** Normal range: 2-7 $\times$ 10^9/L	**Lymphocytes** Normal range: 1.1-5 $\times$ 10^9/L
Screening (−7)	8.2	5.4	1.9
12	8	6.5	1
35	7.3	5.2	1.3
37	9.2	6.1	1.6

On Study Day 35, study treatment with ipatasertib was permanently discontinued as per physician's decision (because patient's health deteriorated, and subsequent CT scans showed progression) with the last dose of ipatasertib administered on Study Day 14. The patient entered into the long term follow up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Carboplatin	44	84

On Study Day 147, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**	**Causality (Atezolizumab)**
Constipation	1	Non-serious	3	4	Unrelated	Unrelated	Unrelated
Diarrhea	1	Non-serious	5	6	Related	Related	Unrelated
Fatigue	2	Non-serious	5	Unresolved	Related	Related	Unrelated
Flushing	1	Non-serious	8	8	Unrelated	Related	Unrelated

Study Number/CRTN:	CO40016/304680	Patient number	3081
Demographics:	65-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Blood alkaline phosphatase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Categories:	Immune-mediated lung disease SAE, Grade ≥ 2 pneumonitis		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER2 negative right breast cancer (T2N3M0) approximately 3 years and 4 months prior to study entry.

On Study Day – 77, the patient was diagnosed with metastatic disease with ER/PR unknown and HER2 receptor not assessed in metastatic tissue. At screening, sites of disease involvement included midline mediastinum, liver (segment II, IVA and IVB), lymph node midline and right lung (segment 9 and 10) and left pleural fluid.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 3 years and 2 months prior to study entry	Approximately 3 years prior to study entry
Cancer therapy	Adjuvant	Paclitaxel (12 cycles)	Approximately 2 years and 11 months prior to study entry	Approximately 2 years and 8 months prior to study entry
Radiotherapy	Adjuvant	Axillary cervical supraclavicular nodes (dose: 5000 cGy)	Approximately 2 years and 7 months prior to study entry	Approximately 2 years and 5 months prior to study entry
Surgery	Curative	Right breast	–160	–
Surgery	Curative	Right breast	–117	–

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension and cancer pain.

At screening, the patient's ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included candesartan, hydrochlorothiazide, bisoprolol and paracetamol.

Event 1: Blood alkaline phosphatase increased (alkaline phosphatase level increase)

Prior to the event of blood alkaline phosphatase increased, the most recent dose of atezolizumab was given on Study Day 1, paclitaxel on Study Day 9, and ipatasertib (400 mg) on Study Day 19.

On Study Day 20, a laboratory work-up showed ALP 437 U/L (normal range: 38-126 U/L), ALT 79 U/L (normal range: 0-34 U/L), AST 80 U/L (normal range: 14-36 U/L) and total bilirubin 0.72 mg/dL (normal range: 0.2-1.3 mg/dL). The patient was diagnosed with non-serious Grade 2 blood alkaline phosphatase increased. No treatment was reported for this event. On Study Day 43, the patient was noted with Grade 2 aspartate aminotransferase increased (non-serious, unrelated; AST 172 U/L normal range: 14-36 U/L). On Study Day 65, the event of blood alkaline phosphatase increased worsened to Grade 3. On Study Day 93, the event of blood alkaline phosphatase increased was considered resolved. The event of aspartate aminotransferase increased was resolving at the time of patient's death (see narrative below).

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 14-36 U/L)	**ALT** (normal range: 0-34 U/L)	**ALP** (normal range: 38-126 U/L)	**Total bilirubin** (normal range: 0.2-1.3 mg/dL)
-13	69	39	112	0.87
20	80	79	437	0.72
30	46	33	177	0.75
37	38	26	141	0.61
43	172	116	457	0.66
58	50	47	204	0.72
64	114	61	948	0.82

72	50	38	291	0.82
79	51	31	166	0.5
93	40	22	121	0.66
100	54	29	137	0.56
107	56	32	158	0.56

There was no change in the study treatment with ipatasertib and paclitaxel due to the event of blood alkaline phosphatase increased; however, study treatment with atezolizumab was interrupted on Study Day 2 and the next dose was given on Study Day 30.

The Investigator considered blood alkaline phosphatase increased to be unrelated to ipatasertib and paclitaxel and related to atezolizumab and disease under study.

Event 2: Immune-mediated lung disease (Suspicion of immune-mediated pneumonitis)

Prior to the event of immune-mediated lung disease, the most recent dose of atezolizumab and paclitaxel was given on Study Day 43, and ipatasertib (400 mg) on Study Day 50.

On Study Day 55, a CT-scan was performed, and the patient was suspected with interstitial pneumonia. She had no symptoms of infection including fever, cough, and increased WBC count. On Study Day 58, an X-ray was performed, and diagnosis of Grade 2 immune-mediated lung disease was made, leading to hospitalization. She received treatment with clarithromycin and paracetamol for immune-mediated lung disease. On Study Day 65, the event of immune-mediated lung disease was considered resolved and she was discharged from the hospital.

Relevant laboratory values listed in the table below:

Study Day	**WBC count** (normal range: 4-10 $\times$ $10^3/\mu L$)	**Absolute neutrophil count** (normal range: 1.8-7.7 $\times$ $10^3/\mu L$)	**Absolute lymphocyte count** (normal range: 1.1-6.5 $\times$ $10^3/\mu L$)
-1	9.11	7.04	1.03
58	16.46	13.32	1.96
64	6.74	3.68	2.02

Due to this event, Cycle 3 Day 1 of atezolizumab and paclitaxel was delayed and treatment with ipatasertib was interrupted on Study Day 50. The next dose was given on Study Day 65.

The Investigator considered immune-mediated lung disease to be unrelated to ipatasertib and paclitaxel and related to atezolizumab.

On Study Day 106, an overall response assessment showed disease progression.

On Study Day 107, the patient was discontinued from the study treatment due to disease progression with the last dose of atezolizumab given on Study Day 93, paclitaxel on Study Day 100 and ipatasertib on Study Day 106. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	119	Ongoing

On Study Day 257, the patient died due to disease progression (as per public records). No information regarding autopsy was reported.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Blood glucose increased	1	Non-serious	9	20	Related	Unrelated	Unrelated
Diarrhea	1	Non-serious	41	42	Unrelated	Unrelated	Unrelated
Diarrhea	1	Non-serious	52	65	Related	Unrelated	Related
Anemia	2	Non-serious	58	Resolving	Unrelated	Related	Unrelated
Blood alkaline phosphatase increased	1	Non-serious	100	Resolving	Unrelated	Unrelated	Unrelated

Demographics:	66-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Gastroenteritis SAE		
Event 2 (PT) Category:	Pyrexia SAE		
Event 3 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		
Event 4 (PT) Category:	Neuropathy peripheral (Grade 1) AE leading to study treatment discontinuation		
Event 5 (PT) Category:	Acute kidney injury SAE		

The patient was randomized on Study Day – 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, right breast cancer (T2N1M1) on Study Day – 49.

On Study Day − 36, ER and HER2 negative, PR status was unknown disease was diagnosed in metastatic tissue. At screening sites of disease involvement included breast (right breast mass), lymph node (right axillary lymph node, right small axillary sub pectoral lymphadenopathy and right small volume right axillary lymph node) and bone (bilateral diffuse bone metastasis).

No past cancer treatment was reported.

The patient′s medical history included menopause. Surgical history included cholecystectomy. Concurrent conditions included diverticulum, hypothyroidism, hypertension, migraine, and arthralgia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included candesartan, levothyroxine, amitriptyline, and paracetamol.

Event 1: Gastroenteritis (Infective gastereneritus)
Event 2: Pyrexia

Prior to the events of gastroenteritis and pyrexia, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel was administered on Study Day 8 and ipatasertib (400 mg) was administered on Study Day 13.

On Study Day 5, the patient experienced intermittent Grade 2 (initial intensity Grade 1) diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide for the event of diarrhea. On Study Day 7, she experienced Grade 1 dyspepsia (non-serious, related to ipatasertib and paclitaxel). She received treatment with omeprazole for the event of dyspepsia. On Study Day 13, she had bowel movement after every 30 minutes of food intake, approximately 8 to 10 times in a day.

On Study Day 14, the patient presented with increased bowel frequency since 3 days, vague cramping in central abdomen, Grade 1 nausea (non-serious, related). She was noted with Grade 2 pyrexia (body temperature: 38.4°C) and diagnosed with Grade 3 gastroenteritis, leading to hospitalization. Her blood pressure was 120/80 mmHg. A laboratory work-up showed: neutrophils 2.0 $\times 10^9$/L (normal range: 1.7-6.2 $\times 10^9$/L), glomerular filtration rate: 86, creatinine: 65 μmol/L (normal range: 50-98 μmol/L), sodium 134 mmol/L (normal range: 133-146 mmol/L), potassium 4.1 mmol/L (normal range: 3.5-5.3 mmol/L) and magnesium 0.68 mmol/L (normal range: 0.7-1 mmol/L). She did not have any other local infection symptoms. She received treatment with piperacillin sodium/tazobactam sodium, enoxaparin, cetirizine, cyclizine and ondansetron. She was still experiencing bowels movements 4 to 5 times a day, although no blood or mucous was present. She also felt lightheaded and dizzy and had reduced oral intake

due to diarrhea. Later, her vitals showed body temperature 37.5°C, blood pressure 115/65 mmHg, heart rate 78 beats/min, respiratory rate 18 breaths/min and oxygen saturation 95 %. Blood culture was negative for methicillin-resistant *Staphylococcus aureus*; *Clostridium difficile* glutamate dehydrogenase test was negative. Feces cultures was negative for *Salmonella*; *Shigella*, *Esherichia coli,* and *Campylobacter*. Later, on the same day (Study Day 14), the event of pyrexia resolved. Her symptoms improved over the next 2 days and on Study Day 16, the event of gastroenteritis was considered resolved. On Study Day 18, she was discharged from the hospital. On Study Day 76, the event of dyspepsia was considered resolved. On Study Day 77, the event of nausea was considered resolved. The event of diarrhea was intermitted but remained unresolved at the time of study discontinuation (see below).

Due to the event of gastroenteritis and pyrexia, Cycle 1 Day 15 of paclitaxel and atezolizumab was not administered. Study treatment with ipatasertib was interrupted after Study Day 13. The next dose of study treatment with paclitaxel, atezolizumab and ipatasertib (at a reduced dose of 300 mg) was given on Study Day 29.

The Investigator considered gastroenteritis, to be related to ipatasertib and unrelated to paclitaxel (causality with atezolizumab was not reported).

The Investigator considered pyrexia, to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

Relevant vital signs:

Study Day	**Body temperature** °C
Screening (−7)	36.6
14	38.2
	38.4
	37.5

The patient experienced three non-serious events of neuropathy peripheral from Study Day 175 to Study Day 230 (details in the AE table below) and received treatment with pyridoxine form Study Day 176 to Study Day 196 for neuropathy peripheral.

Event 3: Neuropathy peripheral (Peripheral neuropathy)
Event 4: Neuropathy peripheral (Peripheral neuropathy; Grade 1)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 225 and paclitaxel (200 mg) on Study Day 230.

On Study Day 231, the pre-existing event of non-serious neuropathy peripheral worsened to Grade 3. No treatment was administered for the event of neuropathy peripheral Prior to the

event of neuropathy peripheral (Grade 1), the most recent dose of paclitaxel was administered on Study Day 225, atezolizumab on Study Day 239 and paclitaxel (200 mg) on Study Day 244.

. On Study Day 252, the event of non-serious neuropathy peripheral improved to Grade 1, but remained unresolved at the time of study discontinuation.

Due to both the events of neuropathy peripheral, there was no change in study treatment with ipatasertib and atezolizumab, however, study treatment with paclitaxel was permanently discontinued with last dose administered on Study Day 225.

The Investigator considered neuropathy peripheral (Grade 3), to be unrelated to ipatasertib and atezolizumab and related to paclitaxel and procedure (unspecified).

The Investigator considered neuropathy peripheral (Grade 1), to be unrelated to ipatasertib and atezolizumab and related to paclitaxel.

Event 5: Acute kidney injury

Prior to the event of acute kidney injury, the most recent dose of atezolizumab was administered on Study Day 267 and ipatasertib (200 mg) on Study Day 272.

On Study Day 280, a laboratory work-up showed creatinine 197 μmol/L (normal range: 50-98 μmol/L) and urea 7.9 mmol/L (normal range: 2.5-7.8 mmol/L), leading to diagnosis of serious Grade 2 (initial intensity) acute kidney injury. Later, on the same day (Study Day 280), the event of acute kidney injury worsened to Grade 3. On Study Day 281, she was hospitalized. She received treatment with unspecified IV fluids and prednisolone; following which the event of acute kidney injury improved to Grade 2. Later, on the same day (Study Day 281), she was discharged from the hospital. On Study Day 288, the event of acute kidney injury was considered resolved.

Due to the event of acute kidney injury, study treatment with ipatasertib was interrupted on Study Day 273, Cycle 11 Day 1 of atezolizumab was not administered. The next dose was given on Study Day 309.

The Investigator considered acute kidney injury, to be unrelated to ipatasertib and paclitaxel and related to atezolizumab.

Relevant laboratory work-up:

Study Day	Creatinine Normal range : 50-98 μmol/L	Urea Normal range : 2.5-7.8 mmol/L
Screening	57	2.8
280	197	7.9
	195	7.7
281	205	8.4
283	145	9.4
283	145	9.4
288	93	6.6

On Study Day 758, the study treatment and study was permanently discontinued due to other reason (the patient entered to post trial assessment program) with last dose of atezolizumab administered on Study Day 744 and ipatasertib on Study Day 750.

Other AEs experienced by the patient during the study:

A narrative for this patient is available in Section 1.1 Narratives for patients who died due to an adverse event(s).

Study Number/CRTN:	CO40016/304792	Patient number	3091
Demographics:	51-year-old Black or African American female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Categories:	Rash SAE, Grade ≥ 3 rash		
Event 2 (PT) Categories:	Hypersensitivity SAE, AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T3N1M1) on Study Day − 79.

The patient was diagnosed with metastatic disease on Study Day − 77 with ER/PR negative and HER2 negative disease. At screening, sites of disease involvement included left breast (laterals and inferior quadrants) and lymph node (left axillary and inter pectoral and retro pectoral) and left lung (pleural effusion).

No past cancer treatments are reported.

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension and headache.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, atezolizumab and paclitaxel.

Concomitant medication ongoing at Study Day 1 included losartan.

Event 1: Rash

Prior to the event of rash, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 13.

On Study Day 14, the patient presented to the emergency room with Grade 2 rash all over body and face associated with itching and high fever (body temperature not reported). She also complaints about lesions inside the mouth making her difficult to eat. She received treatment

with metamizole. Her laboratory work-up was unaltered. Urine and blood test were reported negative. On Study Day 17, the event of rash worsened to Grade 3, leading to hospitalization. She then received treatment with hydroxyzine and prednisone. On Study Day 20, the event of rash was considered resolved and she was discharged from the hospital.

Due to the event of rash, Cycle 1 Day 15 of atezolizumab and paclitaxel was not administered, treatment with ipatasertib was interrupted on Study Day 15. The next dose of study treatment was given on Study Day 29.

The Investigator considered rash to be related to ipatasertib and atezolizumab and unrelated to paclitaxel.

Event 2: Hypersensitivity (allergic reaction)

Prior to the event of hypersensitivity, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 99 and ipatasertib (400 mg) on Study Day 101.

On Study Day 104, the patient presented to the emergency room with rash (erythema plus sensibility increase) all over the body and face associated with edema and high fever (body temperature not reported). Her laboratory work-up was unaltered. Urine and blood test were reported negative. The patient was diagnosed with Grade 3 hypersensitivity, leading to hospitalization (initial intensity Grade 2). She received treatment with prednisone, promethazine and metamizole for hypersensitivity. On Study Day 108, the event of hypersensitivity was considered resolved and she was discharged from the hospital.

Due to the event of hypersensitivity, study treatment with atezolizumab, paclitaxel and ipatasertib was permanently discontinued with the last dose of atezolizumab and paclitaxel was given on Study Day 99 and ipatasertib on Study Day 104. The patient entered into the long-term follow-up.

The Investigator considered hypersensitivity, to be related to atezolizumab and unrelated to ipatasertib and paclitaxel.

On Study Day 167, a radiographic response assessment showed disease progression.

On Study Day 701, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Alopecia	1	Non-serious	20	Unresolved	Unrelated	Related	Unrelated

Study Number/CRTN:	CO40016/304878	Patient number	3102
Demographics:	67-year-old Asian female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Pyrexia SAE		

The patient was randomized on Study Day − 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER2 negative right breast cancer (T4N3cM1), on Study Day − 65, prior to study entry.

At screening, sites of disease involvement included lymph node (right medial and lateral axilla, right infraclavicular and right supraclavicular), right breast and right overlying breast.

No past cancer treatments are reported.

The patient′s medical history included pulmonary tuberculosis and thyroid mass. No surgical history was reported. Concurrent conditions included right breast pain, lymph node pain and osteopenia.

At screening, the patient′s ECOG Performance Status was 0.

Relevant laboratory work-up reported in the table below:

Study Day	**WBC count** (normal range: 4-10 × 10^3/μL)	**Neutrophils** (normal range:50-75%)	**Lymphocytes** (normal range: 20-44%)	**Body temperature** (°C)
-13	6.1	55.3	37.2	36.7

On Study Day 1, the patient received her first study treatment with ipatasertib paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included paracetamol/tramadol, fexofenadine and levocetirizine.

Event: Pyrexia (fever)

Prior to the event of pyrexia, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 9.

On Study Day 10, the patient experienced Grade 1 pyrexia (body temperature around 37°C) along with Grade 1 asthenia (non-serious, related), Grade 1 decreased appetite and Grade 1 dizziness (both non-serious, unrelated). She received treatment with ketorolac, ciprofloxacin, and paracetamol. On the following day (Study Day 11), the patient experienced Grade 1 skin rash (non-serious related to ipatasertib and atezolizumab) and received treatment with chlorphenamine. On Study Day 13, the event of pyrexia worsened to Grade 2 (body temperature 39.3°C), leading to hospitalization. A laboratory work-up showed WBC count 2, hemoglobin 11.6, platelet count 230, absolute neutrophil count 1190 (units and normal range not reported for all). Test for influenza A and B was negative. A chest X-ray did not show any active lung lesion. A test for COVID-19 was negative. She further received treatment with piperacillin/tazobactam, paracetamol and ketorolac. On Study Day 14, the event of dizziness was considered resolved. On Study Day 15, the event of pyrexia was considered resolved. On Study Day 16, the event of decreased appetite was considered resolved. On Study Day 21, the event of rash was considered resolved. On Study Day 22, the patient was discharged from the hospital. The event of asthenia remained unresolved at the time of patient′s death (see narrative below).

Due to this event, Cycle 1 Day 8 of paclitaxel was not administered, and Cycle 1 Day 15 was delayed and was administered on Study Day 22. Cycle 1 Day 15 of atezolizumab was not administered and the next dose was administered on Study Day 30. Study treatment with

ipatasertib was interrupted on Study Day 11 and the next dose was given on Study Day 22 (400 mg).

The Investigator considered pyrexia to be unrelated to ipatasertib and paclitaxel and related to atezolizumab.

On Study Day 162, an overall response assessment showed disease progression.

On Study Day 170, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab given on Study Day 128, paclitaxel on Study Day 156 and ipatasertib on Study Day 162. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	**Start Day**	**Stop Day**
Doxorubicin and cyclophosphamide (6 cycles each)	170	275
Eribulin (single cycle)	350	358

On Study Day 378, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / non-serious**	**Onset Day**	**Resolution Day / Outcome**	**Causality (Ipatasertib)**	**Causality (Paclitaxel)**	**Causality (Atezolizumab)**
Alopecia	2	Non-serious	22	Unresolved	Unrelated	Related	Unrelated
Urticaria	1	Non-serious	22	22	Unrelated	Related	Unrelated
Productive cough	1	Non-serious	35	51	Related	Related	Related

1.4 NARRATIVES FOR PATIENTS WHO DISCONTINUED STUDY TREATMENT DUE TO AN ADVERSE EVENT

Study Number/CRTN:	CO40016/319067	Patient number	3001
Demographics:	55-year-old female (race unknown)		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Categories:	Dystonia SAE, AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Mixed connective tissue disease AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 4 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 5 (PT) Category:	Skin infection SAE		
Event 6 (PT) Category:	Vomiting SAE		
Event 7 (PT) Categories:	Alanine aminotransferase increased SAE, Grade ≥ 3 hepatotoxicity		
Event 8 (PT) Categories:	Aspartate aminotransferase increased SAE, Grade ≥ 3 hepatotoxicity		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/305639	Patient number	3002
Demographics:	43-year-old Black or African American female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Vomiting SAE		
Event 2 (PT) Category:	Diarrhea SAE		
Event 3 (PT) Category:	Pyrexia SAE		
Event 4 (PT) Category:	Pneumonia SAE		
Event 5 (PT) Category:	Flushing AE leading to study treatment discontinuation		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304448	Patient number	3012
Demographics:	58-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Rash maculo-papular Grade ≥ 3 rash		
Event 2 (PT) Category:	Hyperglycemia (First episode) Grade ≥ 3 hyperglycemia		
Event 3 (PT) Category:	Hyperglycemia (Second episode) Grade ≥ 3 hyperglycemia		

Event 4 (PT) Categories:	Hyperglycemia (Third episode) AE leading to study treatment discontinuation, Grade ≥ 3 hyperglycemia
Event 5 (PT) Categories:	Diabetic ketoacidosis SAE, AE leading to study treatment discontinuation, Grade ≥ 3 hyperglycemia
Event 6 (PT) Category:	Hyperglycemia (Fourth episode) Grade ≥ 3 hyperglycemia
Event 7 (PT) Categories:	Hyperglycemia (Fifth episode) AE leading to study treatment discontinuation, Grade ≥ 3 hyperglycemia

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304880	Patient number	3014
Demographics:	65-year-old Asian female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Peripheral sensory neuropathy AE leading to study treatment discontinuation		
Event 2 (PT) Category:	Hyperglycemia Grade ≥ 3 hyperglycemia		
Event 3 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was diagnosed with lobular, ER/PR and HER2 negative, metastatic right breast cancer (T2N1M1, histological grade unknown) on Study Day -42.

At screening, sites of disease involvement included right breast, lymph node (metastatic lymph nodes in the left paraaortic space and hepatoduodenal ligament) and bone (multiple bone metastasis).

No past cancer treatments were reported.

No medical or surgical history was reported. The patient′s concurrent conditions included Grade 1 hypertension, Grade 1 hyperlipidemia, Grade 1 breast pain, Grade 1 myoclonus, Grade 1 right facial paralysis, intracranial aneurysm, and type 2 diabetes mellitus.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included fimasartan potassium trihydrate, rosuvastatin, rebamipide, codeine phosphate/ibuprofen/paracetamol, oxycodone, loperamide and levocetirizine.

Event 1: Peripheral sensory neuropathy

Prior to the event of peripheral sensory neuropathy, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 57 and ipatasertib (400 mg) on Study Day 63.

On Study Day 64, the patient experienced non-serious Grade 1 (initial intensity) peripheral sensory neuropathy (signs and symptoms not reported). She received treatment with pregabalin and duloxetine for the event of peripheral sensory neuropathy. On Study Day 288, the event of peripheral sensory neuropathy worsened to Grade 3. On Study Day 393, the event of peripheral sensory neuropathy improved to Grade 2. The event of peripheral sensory neuropathy remained unresolved at the time of patient′s death (see below).

Due to the event of peripheral sensory neuropathy, there was no change in study treatment with ipatasertib and atezolizumab, however, study treatment with paclitaxel was permanently discontinued with last dose administered on Study Day 281.

The Investigator considered peripheral sensory neuropathy, to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Event 2: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of atezolizumab was administered on Study Day 253, paclitaxel on Study Day 260, and ipatasertib (200 mg) on Study Day 265.

On Study Day 266, the patient’s laboratory work-up showed blood glucose: 336 mg/dL (normal range: 70-110 mg/dL). She was diagnosed with non-serious Grade 3 hyperglycemia. No treatment was administered for the event. On Study Day 274, the event of hyperglycemia was considered resolved.

Due to the event of hyperglycemia, study treatment with atezolizumab, paclitaxel and ipatasertib was interrupted. The next dose of paclitaxel was administered on Study Day 274, atezolizumab and ipatasertib on Study Day 281.

The Investigator considered hyperglycemia, to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Relevant laboratory work-up:

Study Day	**Glucose** Normal range: 70-110 mg/dL	**HbA1c** Normal range: 4-6%
Screening	120	7.4
266	336	—
274	100	—

Event 3: Aspartate aminotransferase increased

Prior to the event of aspartate aminotransferase increased, the most recent dose of atezolizumab and ipatasertib (200 mg) on Study Day 533.

On Study Day 533, the patient's laboratory work-up showed: AST 66 U/L (normal range: 13-34 U/L). On Study Day 534, she was diagnosed with non-serious Grade 1 (initial intensity) aspartate aminotransferase increased. No treatment was administered for the event. On Study Day 617, the event of aspartate aminotransferase increased worsened to Grade 3.

On the same day (Study Day 617), radiographic response assessment showed disease progression with new lesions in right lung (small lobulated nodule in right lower lobe).

On Study Day 619, the event of aspartate aminotransferase increased improved to Grade 2.

There was no change in study treatment due to the event of aspartate aminotransferase increased.

On Study Day 624, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab administered on Study Day 603 and ipatasertib administered on Study Day 609. The patient entered into the long-term follow-up.

On Study Day 729, the event of aspartate aminotransferase increased was considered resolved.

The Investigator considered aspartate aminotransferase increased, to be unrelated to ipatasertib, paclitaxel and atezolizumab and related to disease under study.

Relevant laboratory work-up:

Study Day	AST Normal range: 13-34 U/L	ALT Normal range: 5-46 U/L	Total bilirubin Normal range: 0.4-1.5 mg/dL	ALP Normal range: 50-155 U/L
Screening (– 6)	23	8	0.3	196
533	66	26	0.5	208
547	39	7	0.3	163
561	70	10	0.5	226
575	40	6	0.4	257
589	51	7	0.5	288
603	73	12	0.6	233
617	271	30	0.9	293
	214	—	—	—
619	135	—	—	—
624	149	24	0.7	261

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	624	Ongoing

On Study Day 801, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)

A narrative for this patient is available in Section 1.1 Narratives for patients who died due to an adverse event(s).

Study Number/CRTN:	CO40016/306603	Patient number	3020

Demographics:	46-year-old White female
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)
Cohort:	Cohort C
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation

The patient was randomized on Study Day – 2.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative, right breast cancer (T2N1M0) approximately 3 years and 6 months prior to study entry.

On Study Day – 57, the patient was diagnosed with metastatic disease with ER/PR and HER 2 negative in metastatic tissues. At screening sites of disease involvement included lymph node (right axillary, retro pectoral nodes and mediastinal nodes) and bone (right sclerotic lesion right femur and right intertrochanteric right femur).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide	Approximately 3 years and 5 months prior to study entry	Approximately 3 years and 3 months prior to study entry
Cancer therapy	Neoadjuvant	Leuprorelin acetate	Approximately 3 years and 5 months prior to study entry	Approximately 3 years and 1 month prior to study entry
Cancer therapy	Neoadjuvant	Paclitaxel	Approximately 3 years and 3 months prior to study entry	Approximately 3 years and 1 month prior to study entry
Surgery	Curative	Simple mastectomy of right breast	Approximately 3 years prior to study entry	NA
Radiotherapy	Adjuvant	Right breast (chest wall) (dose: 5000 cGy and 25 fraction)	Approximately 3 years prior to study entry	Approximately 2 years and 11 months prior to study entry

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Capecitabine	Approximately 2 years and 11 months prior to study entry	-861

No medical or surgical history was reported. The patient′s concurrent conditions included gastroesophageal reflux disease, seasonal allergy, hiatus hernia, vitamin D deficiency, anxiety, hepatic steatosis, pulmonary mass, insomnia and lichen striatus.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included cholecalciferol, loperamide and lidocaine/prilocaine.

Event: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of atezolizumab was administered on Study Day 57, paclitaxel on Study Day 64 and ipatasertib (400 mg) on Study Day 70.

On Study Day 71, the patient experienced non-serious Grade 1 (initial intensity) neuropathy peripheral (signs and symptoms not reported). No treatment was administered for the event. On Study Day 148, the event of neuropathy peripheral worsened to Grade 2. On Study Day 176, the event of neuropathy peripheral improved to Grade 1. On Study Day 225, the event of neuropathy peripheral again worsened to Grade 2. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib and atezolizumab, however, study treatment with paclitaxel was permanently discontinued with last dose administered on Study Day 210.

The Investigator considered neuropathy peripheral, to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

On Study Day 277, radiographic response assessment showed disease progression with new lesions in right axillary lymph node (equivocal).

On Study Day 440, a repeat radiographic response assessment showed disease progression with new lesions lymph node (aortopulmonary window node and mesenteric nodes) and bone (left femoral diaphysis).

On Study Day 461, study treatment was permanently discontinued due to disease progression with the last dose of ipatasertib administered on Study Day 413 and atezolizumab on Study Day 433. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Sacituzumab govitecan	475	733
Bevacizumab and capecitabine	774	Ongoing

On Study Day 908, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)

Study Number/CRTN:	CO40016/304332	Patient number	3022
Demographics:	57-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Rash papular Grade ≥ 3 rash		
Event 2 (PT) Category:	Autoimmune hepatitis AE leading to study treatment discontinuation		
Event 3 (PT) Category:	Aspartate aminotransferase increased AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated, ER/PR negative and HER2 negative right breast cancer (T4N1M1) on Study Day − 29.

At screening, sites of disease involvement included right breast and right lung (segment 6), right side of chest, right axillary lymph node, bilateral lung, bone (right IV, V ribs) and bone Th1.

No past cancer treatments are reported.

No medical/surgical history was reported. The patient′s concurrent condition included renal cyst.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event 1: Rash papular (Papular rash on body)

Prior to the event of rash papular, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 15 and ipatasertib (400 mg) on Study Day 21.

On Study Day 22, the patient experienced non-serious Grade 3 rash papular all over the body except head. She received treatment with loratadine and prednisolone for rash papular. On Study Day 33 the event of rash was considered resolved.

There was no change in the study treatment due to the event of rash papular.

The Investigator considered rash papular to be related to atezolizumab and unrelated to paclitaxel and ipatasertib.

Event 2: Autoimmune hepatitis

Prior to the event of autoimmune hepatitis, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 197 and ipatasertib (400 mg) on Study Day 203.

On Study Day 204, a laboratory work-up showed ALP 142.1 U/L (normal range: 42-98 U/L), ALT 182 U/L (normal range: 4-36 U/L) and AST 177 U/L (normal range: 8-33 U/L) and the patient was diagnosed with non-serious Grade 3 autoimmune hepatitis. On the following day (Study Day 205), a PCR test for synevo-hepatitis C virus and hepatitis B virus was negative. She received treatment with phospholipids, *Cynara cardunculus* extract, arginine/betaine/betaine hydrochloride and prednisolone. On Study Day 215, the event of autoimmune hepatitis was considered resolved.

Due to the event of autoimmune hepatitis, study treatment with paclitaxel was delayed and the next dose was administered on Study Day 253 (Cycle 10 Day 1), atezolizumab and ipatasertib was permanently discontinued with the last dose administered on Study Day 197 and Study Day 203, respectively.

The Investigator considered autoimmune hepatitis to be unrelated to paclitaxel and ipatasertib and related to atezolizumab.

Event 3: Aspartate aminotransferase increased (Increasing of AST)

Prior to the event of aspartate aminotransferase increased, the most recent dose of paclitaxel was administered on Study Day 295.

On Study Day 279, a laboratory work-up showed ALT 92 U/L (normal range: 4-36 U/L) and the patient was diagnosed with Grade 1 alanine aminotransferase increased (non-serious, related to paclitaxel).

On Study Day 307, a laboratory work-up showed AST 102 U/L (normal range: 8-33 U/L) and the patient was diagnosed with non-serious Grade 2 aspartate aminotransferase increased. She received treatment with phospholipids. On Study Day 288, the event of alanine aminotransferase increased was considered resolved. The event of aspartate aminotransferase increased remained unresolved at the time of patient's death (see narrative below).

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 8-33 U/L)	**ALT** (normal range: 4-36 U/L)	**ALP** (normal range: 42-98 U/L)	**Bilirubin** (normal range: 4.27-20.52 μmol/L)
-2	42	11	81.2	12
204	177	182	142.1	12.8
208	153	167	132.9	11.3

Due to the event of aspartate aminotransferase increased, study treatment with paclitaxel was permanently discontinued with the last dose administered on Study Day 295. The patient entered into the long-term follow-up.

The Investigator considered aspartate aminotransferase increased to be related to paclitaxel and unrelated to ipatasertib.

On Study Day 391, a radiographic response assessment showed disease progression with new lesions in right bone (ilium) and mediastinum lymph node.

On Study Day 648, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/318721	Patient number	3030
Demographics:	71-year-old female (Race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Categories:	Autoimmune hepatitis SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304784	Patient number	3044
Demographics:	44-year-old female (Unknown race)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Diarrhea AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with not otherwise specified, poorly differentiated ER/PR negative and HER2 negative right breast cancer (T2N0M1) approximately 2 years and 4 months prior to study entry.

On Study Day – 54, the patient was diagnosed with ER/PR negative and HER2 negative in metastatic tissue. At screening, sites of disease involvement included lung (pulmonary nodule of the anterior segment of the left upper lobe and bilateral other pulmonary nodules).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right mastectomy	Approximately 2 years 2 months prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin, cyclophosphamide, and docetaxel (4 cycles each)	Approximately 2 years prior to study entry	Approximately 1 years 7 months prior to study entry

No medical/surgical history was reported. No concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

The patient was discontinued from the study treatment with paclitaxel as per physician′s decision with the last dose of paclitaxel given on Study Day 759.

Prior to the event of diarrhea, the patient was noted with multiple events of diarrhea (please refer to table below for details). She received treatment with loperamide.

Event	Most extreme grade	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Diarrhea	2	843	843	Related	Unrelated	Unrelated
Diarrhea	2	847	847	Related	Unrelated	NA
Diarrhea	2	853	853	Related	Unrelated	NA
Diarrhea	2	881	881	Related	Unrelated	Unrelated
Diarrhea	1	883	883	Related	Unrelated	Unrelated

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was given on Study Day 906 and ipatasertib (400 mg) on Study Day 909.

On Study Day 910, the patient experienced non-serious Grade 1 diarrhea. She received treatment with loperamide for diarrhea. Later, on the same day, the event of diarrhea was considered resolved.

Loperamide treatment details:

Due to the event od diarrhea and as per physician′s decision (patient to enter roll over study), study treatment with atezolizumab was permanently discontinued with the last dose administered on Study Day 906.

On Study Day 913, the patient was discontinued from the study treatment with ipatasertib as per physician′s decision (patient to enter roll over study) with the last dose of ipatasertib given on Study Day 912.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Other AEs experienced by the patient during the study:

Event 4 (PT) Categories:	Pneumonitis SAE, AE leading to study treatment discontinuation, Grade ≥ 2 pneumonitis

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/319083	Patient number	3057
Demographics:	50-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Neutrophil count decreased AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, left breast cancer (T1cN0M0) approximately 7 years and 4 months following left lymph node biopsy.

On Study Day −35, the patient was diagnosed with locally recurrent advanced unresectable, metastatic disease with ER/PR and HER2 negative in metastatic tissues. At screening sites of disease involvement included chest (left wall mass and left additional thoracic adenopathy), and lymph nodes (lateral retro pectoral node and left axillary).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Left breast lumpectomy	Approximately 7 years prior to study entry	NA
Cancer therapy	Adjuvant	Docetaxel and cyclophosphamide	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry
Radiotherapy	Adjuvant	Breast (left breast; total dose: 6080 cGy, 26 fractions) (lumpectomy bed; 1600 cGy, 16 fractions)	Approximately 7 years prior to study entry	Approximately 7 years prior to study entry

The patient's medical history included tobacco use. No surgical history was reported. Concurrent conditions included fatigue and arthralgia (left shoulder radiating down arm).

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medication ongoing at Study Day 1 was reported.

The patient was noted with multiple episodes of neutrophil count decreased (details in the AE table below) from Study Day 64 to Study Day 497. The patient received treatment with filgrastim for neutrophil count decreased.

Event: Neutrophil count decreased

Prior to the event of neutrophil count decreased, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 505 and ipatasertib (200 mg) on Study Day 511.

On Study Day 512, the patient′s laboratory work-up showed neutrophil count 1000 cells/μL (normal range: 1800-8000 cells/μL). She was diagnosed with non-serious Grade 3 neutrophil count decreased. Relevant laboratory work-up is reported in the table below. Unspecified treatment was administered for the event. On Study Day 519, the event of neutrophil count decreased was considered resolved.

Due to the event of neutrophil count decreased, there was no change in study treatment with atezolizumab, however, study treatment with ipatasertib was interrupted on Study Day 512 and the next dose was given Study Day 519. Treatment with paclitaxel was permanently discontinued with last dose administered on Study Day 505.

The Investigator considered neutrophil count decreased, to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

Relevant laboratory work-up:

Study Day	**WBC count** Normal range: 4.5-13 $\times$ $10^3/\mu L$	**Neutrophil count** Normal range: 1800-8000 cells/μL	**Lymphocyte count** Normal range: 1200-5200 cells/μL
Screening	4.2	2400	1200
512	2.5	1000	1000
519	4.0	1600	1100

On Study Day 841, the patient discontinued the study as she entered post trial access program and last dose of ipatasertib was administered on Study Day 805, and atezolizumab on Study Day 827.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304787	Patient number	3061
Demographics:	75-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Category:	Hyperbilirubinemia Grade ≥ 3 hepatotoxicity		
Event 4 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 5 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		
Event 6 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 7 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 8 (PT) Categories:	Aspartate aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative advanced unresectable right breast cancer (T4bN1M0), on Study Day −76.

The patient was diagnosed with metastatic disease on an unspecified day with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included right breast (side and lateral lower quadrant) and axillary right lymph node.

No past cancer treatments are reported.

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included hydrochlorothiazide and losartan.

Event 1: Aspartate aminotransferase increased (AST increase)

Event 2: Alanine aminotransferase increased (ALT increase)

Event 3: Hyperbilirubinemia

Prior to the events of aspartate aminotransferase increased, alanine aminotransferase increased and hyperbilirubinemia the most recent dose of atezolizumab was administered on Study Day 29, paclitaxel on Study Day 36 and ipatasertib (400 mg) on Study Day 49.

On Study Day 56, the Cycle 3 Day 1 laboratory work-up showed AST 328 U/L (normal range: 5-34 U/L), ALT 329 U/L (normal range: 8-42 U/L), total bilirubin 4.17 mg/dL (normal range: 0-1 mg/dL) and lipase 217 U/L (normal range: 3-60 U/L). The patient was diagnosed with non-serious Grade 3 aspartate aminotransferase increased, Grade 3 alanine aminotransferase increased, Grade 3 hyperbilirubinemia and Grade 3 lipase increased (non-serious, related). She received treatment with prednisone. Post re-evaluation, she was asymptomatic with no clinical complaints. On Study Day 59, the event of AST increased improved to Grade 2 which further improved to Grade 1 on Study Day 64. On Study Day 71, the events of aspartate aminotransferase increased, alanine aminotransferase increased, and hyperbilirubinemia were considered resolved. The event of lipase increased was considered resolving at the time of study discontinuation.

Due to the event of aspartate aminotransferase increased, Cycle 2 Day 15 of paclitaxel and atezolizumab was not administered, and Cycle 3 Day 1 was delayed and given on Study Day 73; however, study treatment with ipatasertib was interrupted on Study Day 50 and the next dose was given on Study Day 73 at a reduced dose of 300 mg.

Due to the events of alanine aminotransferase increased, and hyperbilirubinemia, there was no change in the study treatment with atezolizumab; however, Cycle 2 Day 15 of paclitaxel was not administered, and Cycle 3 Day 1 was delayed and given on Study Day 73. Study treatment with ipatasertib was interrupted on Study Day 50 and the next dose was given on Study Day 73 at a reduced dose of 300 mg.

The Investigator considered aspartate aminotransferase increased, alanine aminotransferase increased, and hyperbilirubinemia to be related atezolizumab, paclitaxel and ipatasertib.

Event 4: Aspartate aminotransferase increased (AST increase)

Event 5: Alanine aminotransferase increased (Increase ALT)

Prior to the events of aspartate aminotransferase increased and alanine aminotransferase increased, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 73 and ipatasertib (300 mg) on Study Day 78.

On Study Day 79, Cycle 4 Day 8 laboratory work-up showed AST 203 U/L (normal range: 5-34 U/L) and ALT 306 U/L (normal range: 8-42 U/L). The patient was diagnosed with non-serious Grade 3 aspartate aminotransferase increased and Grade 3 alanine aminotransferase increased. MRI abdomen was normal. She received treatment with prednisone. On Study Day 93, the event of ALT increased improved to Grade 1 and the event of aspartate aminotransferase increased was considered resolved. On Study Day 107, the event of alanine aminotransferase increased was considered resolved.

Due to the event of aspartate aminotransferase increased and alanine aminotransferase increased, Cycle 3 Day 15 of paclitaxel was not administered, and Cycle 4 Day 1 was delayed and given on study treatment Study Day 94. Treatment with ipatasertib was interrupted on Study Day 80 and next dose was given on Study Day 101 (300 mg).

Due to the event of aspartate aminotransferase increased, study treatment with atezolizumab was interrupted after Cycle 3 and due to the event of alanine aminotransferase increased, atezolizumab was permanently discontinued with the last dose given on Study Day 73 (Cycle 3 Day 1).

The Investigator considered aspartate aminotransferase increased, alanine aminotransferase increased to be related atezolizumab, paclitaxel and ipatasertib.

Event 6: Aspartate aminotransferase increased (AST increase)

Event 7: Alanine aminotransferase increased (ALT increase)

Prior to the events of aspartate aminotransferase increased and alanine aminotransferase increased, the most recent dose of paclitaxel was administered and on Study Day 101 and ipatasertib (300 mg) on Study Day 120.

On Study Day 121, Cycle 5 Day 1 laboratory work-up showed AST 363 U/L (normal range: 5-34 U/L) and ALT 290 U/L (normal range: 8-42 U/L), total bilirubin 2.15 mg/dL (normal range: 0-1 mg/dL) and ALP 714 U/L (normal range: 30-105 U/L). The patient was diagnosed with non-serious Grade 3 aspartate aminotransferase increased, non-serious Grade 3 alanine aminotransferase increased, Grade 1 blood alkaline phosphatase increased and Grade 1 hyperbilirubinemia (both non-serious; related to ipatasertib). She received treatment with prednisone. On Study Day 128, the event of AST increased improved to Grade 1. Later the same day (Study Day 128), the events of aspartate aminotransferase, alanine aminotransferase

increased, blood alkaline phosphatase increased, and hyperbilirubinemia were considered resolved.

There was no change in the study treatment with paclitaxel due to the events of aspartate aminotransferase increased and alanine aminotransferase increased; however, study treatment with ipatasertib was interrupted on Study Day 122 and the next dose was given on Study Day 129.

The Investigator considered aspartate aminotransferase increased and alanine aminotransferase increased to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Event 8: Aspartate aminotransferase increased (AST increased)

Prior to the event of aspartate aminotransferase increased, the most recent dose of paclitaxel was administered and on Study Day 129 and ipatasertib (300 mg) on Study Day 134.

On Study Day 135, a laboratory work-up showed AST 98 U/L (normal range: 5-34 U/L), ALT 157 U/L (normal range: 8-42 U/L), total bilirubin 1.67 mg/dL (normal range: 0-1 mg/dL) and alkaline phosphatase 302 U/L (normal range: 30-105 U/L). The patient was diagnosed with non-serious Grade 1 aspartate aminotransferase increased, Grade 2 alanine aminotransferase increased, Grade 2 hyperbilirubinemia and Grade 2 blood alkaline phosphatase increased (all non-serious, related). Her treatment with prednisone was maintained. On Study Day 170, the event of blood alkaline phosphatase increased was considered resolved. On Study Day 191, the event of aspartate aminotransferase increased was considered resolved. On Study Day 205, the event of hyperbilirubinemia was considered resolved. On Study Day 212, the event of alanine aminotransferase increased was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 5-34 U/L)	**ALT** (normal range: 8-42 U/L)	**ALP** (normal range: 30-105 U/L)	**Total bilirubin** (normal range: 0-1 mg/dL)

212	39	32	59	1.11
219	39	26	53	1
238	59	66	236	0.66

There was no change in the study treatment with paclitaxel due to the event of aspartate aminotransferase increased; however, study treatment with ipatasertib was permanently discontinued with the last dose given on Study Day 156.

The Investigator considered aspartate aminotransferase increased to be related to ipatasertib and paclitaxel.

On Study Day 239, study treatment with paclitaxel was permanently discontinued due to other reason (the patient chose to discontinue due to recurrent adverse event related to chemotherapy) with the last dose of paclitaxel given on Study Day 213. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Surgery of right breast	254	–
Radiotherapy to right breast (dose: 5005 cGy; 29 fractions)	337	365

On Study Day 742, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304203	Patient number	3063
Demographics:	55-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day − 1.

The patient was initially diagnosed with ductal, poorly differentiated ER/PR negative and HER2 negative left breast cancer (T1N0M0) on Study Day − 919.

On Study Day −43, the patient was diagnosed with metastatic disease with ER/PR negative and HER 2 negative in metastatic tissue. At screening sites of disease involvement included lymph nodes (left mediastinal, neck, axillary, and internal mammary).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Docetaxel and cyclophosphamide (4 cycles each)	− 873	− 810
Surgery	Curative	Left sentinel lymph node biopsy	− 765	NA
Surgery	Curative	Left simple mastectomy	− 35	NA

The patient's medical history included intraductal proliferative breast lesion. No surgical history was reported. Concurrent conditions included tinnitus, hypertension, post menopause, fatigue,

anxiety, dermatitis contact, activated partial thromboplastin time prolonged, blood cholesterol increased, and insomnia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included lisinopril and loratadine.

Event: Neuropathy peripheral (Neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of atezolizumab, paclitaxel, and ipatasertib (400 mg) was administered on Study Day 29.

On Study Day 29, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral (presenting signs and symptoms not reported). She received treatment with gabapentin. On Study Day 204, the event of neuropathy peripheral worsened to Grade 2. The event of neuropathy peripheral remained unresolved at the time of patient′s death (see narrative below).

Due to this event, there was no change in the study treatment with atezolizumab and ipatasertib; however treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 323.

The Investigator considered neuropathy peripheral to be unrelated to atezolizumab and ipatasertib and related to paclitaxel, and other cause (unspecified).

On Study Day 446, an overall response assessment showed disease progression.

On Study Day 449, study treatment with atezolizumab and ipatasertib was permanently discontinued due to disease progression with the last dose of atezolizumab administered on Study Day 435, and ipatasertib on Study Day 441. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	449	531
Methotrexate	548	Ongoing

On Study Day 608, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305247	Patient number	3066
Demographics:	69-year-old female (race unknown)		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day − 4.

The patient was diagnosed with ductal, moderately differentiated ER negative, PR positive and HER2 negative metastatic left breast cancer (TXNXM1) on Study Day − 55.

At screening sites of disease involvement included lung (bilateral, right lower and inferior lobe) and bone.

No past cancer treatment was reported.

The patient′s medical history included fibroadenoma of breast, uterine leiomyoma, and carpal tunnel syndrome. Surgical history included skin cyst excision, hysterectomy, thyroidectomy, breast tumor excision, and fracture treatment (malleolus fracture). Concurrent conditions included glaucoma, back pain, constipation, dry skin, edema peripheral, hemorrhoids, and hypothyroidism.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included levothyroxine, Chondrus cripus/lidocaine/titanium, and latanoprost.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel, atezolizumab was administered on Study Day 29, and ipatasertib (400 mg) was administered on Study Day 34.

On Study Day 35, the patient experienced non-serious Grade 1 diarrhea. On Study Day 40, the event of diarrhea worsened to Grade 3. She received treatment with loperamide (details in the table below). On Study Day 44, the event of diarrhea improved to Grade 2. On Study Day 46, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	5	5
Diarrhea	6	PO	6	7
Diarrhea	4	PO	18	19
Diarrhea	6	PO	20	20
Diarrhea	4	PO	45	45
Diarrhea	2	PO	59	59
Diarrhea	4	PO	77	78
Diarrhea	2	PO	171	171
Diarrhea	4	PO	172	172
Diarrhea	2	PO	173	174
Diarrhea	2	PO	176	177
Diarrhea	6	PO	178	178
Diarrhea	4	PO	179	181
Diarrhea	6	PO	182	184
Diarrhea	4	PO	185	186
Diarrhea	2	PO	187	191
Diarrhea	4	PO	200	200
Diarrhea	2	PO	206	210
Diarrhea	2	PO	213	213

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	217	218
Diarrhea	2	PO	234	234
Diarrhea	2	PO	239	240
Diarrhea	2	PO	243	243
Diarrhea	2	PO	245	245
Diarrhea	2	PO	258	258
Diarrhea	2	PO	267	267
Diarrhea	2	PO	368	368

Due to this event, there was no change in the study treatment with atezolizumab; however, Cycle 2 Day 15 of paclitaxel was delayed and treatment with ipatasertib was interrupted on Study Day 45. The next dose of paclitaxel and ipatasertib (at a reduced dose of 300 mg from 400 mg) was administered on Study Day 50.

The Investigator considered diarrhea to be related to atezolizumab, ipatasertib and paclitaxel.

On Study Day 110, the patient was diagnosed with Grade 1 neuropathy peripheral on finger and toes (non-serious, related to paclitaxel). No treatment was given for the event.

Event 2: Neuropathy peripheral (Neuropathy; hands and feet)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel, atezolizumab was administered on Study Day 227, and ipatasertib (300 mg) was administered on Study Day 230.

On Study Day 231, the ongoing event of neuropathy peripheral worsened and spread to hands and feet and was considered Grade 2 (presenting signs and symptoms not reported). No treatment was given for the event. On Study Day 355, the event of neuropathy peripheral of hands resolved and neuropathy peripheral of feet improved the patient Grade 1. The event of neuropathy peripheral (feet) remained unresolved at the time of study discontinuation.

Due to this event, there was no change in the study treatment with atezolizumab and ipatasertib; however treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 269.

The Investigator considered neuropathy peripheral to be unrelated to atezolizumab and ipatasertib and related to paclitaxel.

On Study Day 386, an overall response assessment showed disease progression with new lesions in liver (segment VI) and study treatment with atezolizumab and ipatasertib was

permanently discontinued with the last dose of atezolizumab administered on Study Day 381, and ipatasertib on Study Day 385. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	409	576
Pegylated liposomal doxorubicin	583	Ongoing

On Study Day 723, the patient was discontinued from the study as long term follow-up was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)

Study Number/CRTN:	CO40016/319619	Patient number	3068
Demographics:	58-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Polyneuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, moderately differentiated ER/PR negative and HER2 negative right breast cancer (T1N1M0) approximately 3 years and 5 months prior to study entry.

On Study Day – 49, the patient was diagnosed with metastatic disease with ER/PR negative and HER2 negative in metastatic tissue. At screening, sites of disease involvement included right lymph node (upper part of pulmonary hilus) and right lung (V segment and IX segment) and bone (vertebra L1 and Th12).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right simple mastectomy	Approximately 3 years and 1 month prior to study entry	NA
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 3 years and 1 month prior to study entry	Approximately 2 years and 11 months prior to study entry
Cancer therapy	Adjuvant	Docetaxel (4 cycles)	Approximately 2 years and 9 months prior to study entry	Approximately 2 years and 7 months prior to study entry
Radiotherapy	Adjuvant	Right chest wall, supraclavicular, axillary (dose: 5000 cGy; 25 fractions)	Approximately 2 years and 7 months prior to study entry	Approximately 2 years and 6 months prior to study entry

No medical/surgical history was reported. The patient′s concurrent conditions included hypertension, aortic aneurysm, spinal osteoarthritis, and hemorrhoids.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included metoprolol and zofenopril.

Event: Polyneuropathy

Prior to the event of polyneuropathy, the most recent dose of atezolizumab and paclitaxel was given on Study Day 157 and ipatasertib (400 mg) on Study Day 162.

On Study Day 171, the patient was noted with non-serious Grade 1 polyneuropathy (diagnostic details not reported). On Study Day 214, the event worsened to Grade 2. She received treatment with *Borago officinalis* seed oil/nicotinic acid/pantothenic acid/pyridoxine/riboflavin/selenium/thioctic acid/vitamin B1 (unspecified)/vitamin E (unspecified). The event of polyneuropathy was resolving at the time of patient′s death (see narrative below).

There was no change in the study treatment with ipatasertib and atezolizumab; however, study treatment with paclitaxel was reduced from 80 mg/m^2 to 65 mg/m^2 on Study Day 199 and then paclitaxel was permanently discontinued with the last dose given on Study Day 213.

The Investigator considered polyneuropathy to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

On Study Day 372, an overall response assessment showed disease progression with new lesions in brain (left frontal lobe, corpus callosum, thalamus and left cerebellum) and neck (spinal cord at C3/C4).

On Study Day 373, the patient was discontinued from the study treatment due to disease progression with the last dose of atezolizumab given on Study Day 339 and ipatasertib on Study Day 359. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Radiotherapy to brain (dose: 4000 cGy; 5 fractions)	375	379
Radiotherapy to spinal cord in area of Th12	386	390

On Study Day 465, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/306603	Patient number	3072
Demographics:	78-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Dyspnea AE leading to study treatment discontinuation		

The patient was randomized on Study Day – 1.

The patient was initially diagnosed with comedo-ductal, poorly differentiated, ER/PR negative and HER2 positive right breast cancer (T1cN0MX) approximately 2 years and 7 months prior to study entry.

On Study Day – 71, the patient was diagnosed with metastatic disease with ER/PR negative and HER2 negative in metastatic disease. At screening, sites of disease involvement included lung (left lower lobe, right lower lobe nodules and bilateral pulmonary nodules) and left pelvis bone.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right partial mastectomy and right sentinel lymph node	Approximately 2 years and 5 months prior to study entry	=
Cancer therapy	Adjuvant	Paclitaxel and trastuzumab	Approximately 2 years and 5 months prior to study entry	Approximately 2 years and 2 months prior to study entry
Cancer therapy	Adjuvant	Trastuzumab	Approximately 2 years and 2 months prior to study entry	Approximately 1 year and 6 months prior to study entry
Radiotherapy	Adjuvant	Right breast (dose: 4256 cGy; 16 fractions)	Approximately 2 years prior to study entry	Approximately 2 years prior to study entry
Radiotherapy	Adjuvant	Right breast boost (dose: 1000 cGy; 4 fractions)	Approximately 2 years prior to study entry	Approximately 1 year 11 months prior to study entry

No medical history was reported. The patient′s surgical history included left knee arthroplasty, appendicectomy, bilateral cataract operation and cholecystectomy. Concurrent conditions included hypertension, hyperlipidemia, irritable bowel syndrome, arthritis, deafness, sinus tachycardia, intraocular pressure increased, insomnia and urinary tract infection.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included calcium carbonate, lisinopril, melatonin, metoprolol, ezetimibe, fish oil, *Prunus cerasus* and travoprost.

Event: Dyspnea (Intermittent shortness of breath)

Prior to the event of dyspnea, the most recent dose of atezolizumab and paclitaxel was given on Study Day 524 and ipatasertib (300 mg) on Study Day 527.

On Study Day 466, the patient experienced Grade 1 dyspnea exertional (non-serious, unrelated). On Study Day 482, she experienced Grade 1 chest pain (non-serious, unrelated). No treatment was given for these events. On Study Day 497, the event of chest pain was considered resolved.

On Study Day 528, dyspnea exertional resolved; however the patient experienced non-serious Grade 2 dyspnea. she received unspecified treatment for this event. The event of dyspnea remained unresolved at the time of study discontinuation.

Due to this event, there was no change in the study treatment with ipatasertib and atezolizumab; however, study treatment with paclitaxel was reduced from 80 mg/m^2 to 65 mg/m^2 on Study Day 692 and then paclitaxel was permanently discontinued with the last dose given on Study Day 706.

The Investigator considered dyspnea to be unrelated to ipatasertib and atezolizumab related to paclitaxel and other causes (unspecified).

On Study Day 846, the patient was discontinued from the study treatment and study due to transitioned to PTAP with the last dose of atezolizumab and ipatasertib given on the same day (Study Day 846).

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)

Study Number/CRTN:	CO40016/304331	Patient number	3074
Demographics:	68-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Encephalopathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day − 1.

The patient was diagnosed with poorly differentiated not otherwise specified ER/PR negative and HER2 negative metastatic right breast cancer (T4N2M1) on Study Day − 58, following right breast biopsy on the same day.

At screening sites of disease involvement included lymph nodes (sub-aortal and right axillary), and right breast.

No past cancer treatment was reported.

No medical/surgical history was reported. The patient′s concurrent conditions included varicose vein (lower extremities; Grade 2), peripheral venous disease (Grade 2), ovarian cyst (left; Grade 1), myocardial ischemia, arteriosclerosis coronary artery (Grade 1), spinal pain (Grade1), pulmonary fibrosis (Grade 1), and degenerative bone disease (Grade 1).

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included trimetazidine, acetylsalicylic acid/magnesium hydroxide, rosuvastatin, diosmin/hesperidin, and heparin.

Event: Encephalopathy

Prior to the event of encephalopathy, the most recent dose of paclitaxel was administered on Study Day 337, atezolizumab, and ipatasertib (400 mg) on Study Day 372.

On Study Day 373, laboratory work-up showed D-dimer 663 ng/mL, albumin 40 g/L (normal range not reported) and normal procalcitonin. The patient was diagnosed with non-serious Grade 2 encephalopathy (symptoms and further assessments not reported). She received treatment with prochlorperazine, lactose/peptone, thioctic acid, ipidacrine, and thiotriazoline. The event of encephalopathy remained unresolved at the time of study discontinuation.

Due to this event, there was no change in the study treatment with atezolizumab and ipatasertib; however, treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 337.

The Investigator considered encephalopathy to be unrelated to atezolizumab and ipatasertib and related to paclitaxel.

On Study Day 1135, study treatment with atezolizumab and ipatasertib and study was permanently discontinued as patient stared PTA program with the last dose of atezolizumab administered on Study Day 1114, and ipatasertib on Study Day 1121.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/319619	Patient number	3076
Demographics:	65-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Polyneuropathy AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with mucinous moderately differentiated ER/PR negative and HER2 negative left breast cancer (T2N0M0) on Study Day − 924.

On Study Day −172, the patient was diagnosed with metastatic disease with ER/PR negative and HER 2 negative in metastatic tissue. At screening sites of disease involvement included lung (left IV and X segment and right side).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	– 778	– 715
Cancer therapy	Adjuvant	Paclitaxel (12 cycles)	– 694	– 617
Radiotherapy	Adjuvant	Left breast area (5250 cGy and 21 fractions)	– 595	– 565

No medical/surgical history was reported. Concurrent conditions included anal fistula, dyslipidemia, depression, hypothyroidism, and glaucoma.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included sertraline, trazodone, levothyroxine, and dorzolamide.

Event: Polyneuropathy

Prior to the event of polyneuropathy, the most recent dose of atezolizumab was administered on Study Day 198, paclitaxel, and ipatasertib (300 mg) on Study Day 205.

On Study Day 205, the patient was diagnosed with non-serious Grade 1 polyneuropathy (presenting signs and symptoms not reported). No treatment was given for the event. The event of polyneuropathy remained resolving at the time of patient's death (see narrative below).

Due to this event, there was no change in the study treatment with atezolizumab and ipatasertib; however, treatment with paclitaxel was permanently discontinued with the last dose given on Study Day 212.

The Investigator considered polyneuropathy to be unrelated to atezolizumab and ipatasertib and related to paclitaxel.

On Study Day 269, an overall response assessment showed disease progression with new lesions in liver (segment IV and VI).

On Study Day 282, study treatment with atezolizumab and ipatasertib was permanently discontinued due to disease progression with the last dose of atezolizumab administered on Study Day 268, and ipatasertib on Study Day 273. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Carboplatin (10 cycles)	289	352
Capecitabine	381	Ongoing

On Study Day 507, the patient died due to disease progression. It was unknown if an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Cohort:	Cohort C		
Event (PT) Categories:	Large intestine perforation SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/312641	Patient number	3078
Demographics:	55-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, left breast cancer (T1cN2aMX) on Study Day − 645.

On Study Day − 76, the patient was diagnosed with metastatic disease with ER/PR and HER2 receptor negative in metastatic tissue. At screening, sites of disease involvement included lymph nodes (right hilar) and bone (spine).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Epirubicin, cyclophosphamide and docetaxel	-630	-508
Surgery	Curative	'Other' surgery of left breast	-475	NA
Radiotherapy	Adjuvant	Left breast and internal mammary chain and level II - IV axillary lymph nodes (dose unknown, 15 fractions)	-421	-401
Radiotherapy	Adjuvant	Breast boost (dose unknown, 5 fractions)	-400	-394

The patient's medical history included pneumonia. No surgical history was reported. No concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medication ongoing at Study Day 1 was reported.

Event: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 13.

On Study Day 14, the patient was noted with non-serious Grade 1 (initial intensity) neuropathy peripheral. No treatment was administered for the event. On Study Day 58, the event of neuropathy peripheral worsened to Grade 2. On Study Day 79, the event of neuropathy peripheral worsened to Grade 3. On Study Day 114, the event of neuropathy peripheral improved to Grade 1. The event of neuropathy peripheral remained unresolved at the time of patient′s death (see narrative below).

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib and atezolizumab, however, study treatment with paclitaxel was permanently discontinued with last dose administered on Study Day 65.

The Investigator considered neuropathy peripheral, to be related to paclitaxel, and unrelated to ipatasertib and atezolizumab.

On Study Day 110, a radiographic response assessment showed disease progression with new lesions in lymph nodes (right-sided retrocrural nodes and left renal artery lymph node) and soft tissue (gastro hepatic space soft tissue).

On Study Day 135, study treatment with ipatasertib and atezolizumab was permanently discontinued due to disease progression with the last dose of atezolizumab and ipatasertib administered on Study Day 100 and Study Day 106, respectively. The patient entered into the long term follow up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine	114	170
Carboplatin	202	362
Radiotherapy to brain (dose: 2100 cGy, 1 fraction)	226	226

On Study Day 455, the patient died due to disease progression. It was unknown whether an autopsy was performed or not.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Fatigue	1	Non-serious	4	Unresolved	Related	Related	Unrelated

Study Number/CRTN:	CO40016/304891	Patient number	3080
Demographics:	49-year-old White female		

Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)
Cohort:	Cohort C
Event (PT) Categories:	Pneumonia SAE, AE leading to study treatment discontinuation

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304332	Patient number	3082
Demographics:	68-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative (HER2 receptor not assessed) right breast cancer (T2N1M0) approximately 4 years and 1 month prior to study entry.

The patient was diagnosed with metastatic disease on Study Day – 93 with ER /PR negative and HER2 negative disease. At screening, sites of disease involvement included lymph node (right lung, segment 3, right conglomerate of left nodes upper clavicular, greater pectoral muscle small pectoral muscle, right neck, right basal and broncho pulmonal) and bilateral lung.

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Right radical mastectomy	Approximately 4 years prior to study entry	–
Cancer therapy	Adjuvant	Cyclophosphamide, doxorubicin, and fluorouracil (4 cycles each)	Approximately 3 years and 11 months prior to study entry	Approximately 3 years and 9 months prior to study entry

The patient′s medical history included cholelithiasis. Surgical history included cholecystectomy and appendicectomy. Concurrent conditions included arthralgia (right shoulder) and splenic granuloma.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, atezolizumab and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of atezolizumab was administered on Study Day 113, paclitaxel and ipatasertib (200 mg) on Study Day 120.

On Study Day 121, the patient was diagnosed with non-serious Grade 1 neuropathy peripheral (assessment details not reported). She received treatment with cyanocobalamin/cytidine/disodium uridine/folic acid, ipidacrine, pentoxifylline, choline alfoscerate, cytidine, thioctic acid and pregabalin for neuropathy peripheral. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Relevant grade changes reported in the table below:

Event	Study Day	Grade change
Peripheral neuropathy	150	3
Peripheral neuropathy	175	2
Peripheral neuropathy	887	3

Due to the event of neuropathy peripheral, there was no change in the study treatment with ipatasertib and atezolizumab; however, study treatment with paclitaxel was initially reduced from 80 mg/m^2 to 65 mg/m^2 on Study Day 176 and later permanently discontinued with the last dose given on Study Day 883.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to atezolizumab and ipatasertib.

On Study Day 966, study treatment was permanently discontinued as per physician′s decision (for safety and patient interest) with the last dose of ipatasertib given on Study Day 693 and atezolizumab on Study Day 883. The patient entered into the long-term follow-up.

On Study Day 986, the patient was discontinued from the study as long term follow up was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Diarrhea	1	Non-serious	5	5	Related	Unrelated	Unrelated
Diarrhea	1	Non-serious	7	21	Related	Unrelated	Unrelated
Alopecia	1	Non-serious	17	561	Unrelated	Related	Unrelated
Diarrhea	1	Non-serious	30	49	Related	Unrelated	Unrelated
Accidental overdose	1	Non-serious	65	65	Unrelated	Unrelated	Unrelated
Accidental overdose	1	Non-serious	80	81	Related	Unrelated	Unrelated
Diarrhea	1	Non-serious	85	86	Related	Unrelated	Unrelated
Rib fracture	1	Non-serious	167	223	Unrelated	Unrelated	Unrelated
Cerebrovascular insufficiency	3	Non-serious	887	Unresolved	Unrelated	Related	Unrelated

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304785	Patient number	3088
Demographics:	51-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		

Event 3 (PT) Categories:	Aspartate aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity
Event 4 (PT) Categories:	Alanine aminotransferase increased (Second episode) AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day 1.

The patient was initially diagnosed with unspecified histology, moderately differentiated, ER/PR and HER2 negative, right breast cancer (TXN1M1) approximately 2 years and 9 months prior to study entry.

On Study Day – 91, the patient was diagnosed with metastatic disease with ER/PR and HER2 negative in metastatic tissue. At screening sites of disease involvement included lymph node (right axillary lymph node in superficial chain, right cervical VI lymph node and midline infiltrated at the cervical level V).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Surgery	Curative	Radical mastectomy of right breast and right sentinel lymph node iopsy	-783	NA
Cancer therapy	Adjuvant	Tamoxifen	-728	-90
Radiotherapy	Adjuvant	Right breast (dose: 5000 cGy, 25 fractions)	-726	-721

No medical or surgical history was reported. The patient′s concurrent condition included pain in the right upper limb.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included codeine phosphate/paracetamol and amitriptyline.

The patient received treatment with loperamide (total daily dose: 4 mg, PO) for diarrhea from Study Day 1 to Study Day 15.

On Study Day 16, the patient experienced Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (details in the table below). On Study Day 52, the event of diarrhea was considered resolved.

On Study Day 65, the patient experienced another episode of Grade 1 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide (details in the table below). On Study Day 89, the event of diarrhea was considered resolved.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab, paclitaxel and ipatasertib (400 mg) was administered on Study Day 101.

On Study Day 102, the patient experienced non-serious Grade 3 diarrhea. No diagnostic test was performed. She received treatment with loperamide (details in the table below). On Study Day 108, the event of diarrhea was considered resolved.

Due to the event of diarrhea, there was no change in study treatment with paclitaxel and atezolizumab, however, study treatment with ipatasertib was reduced to 300 mg on Study Day 115.

The Investigator considered diarrhea, to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	15
Diarrhea	2	PO	18	52
Diarrhea	2	PO	76	89
Diarrhea	12	PO	102	108

Event 2: Alanine aminotransferase increased (ALT elevation)

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 129 and ipatasertib (300 mg) on Study Day 135.

On Study Day 142, a laboratory work-up showed ALT 178 U/L (normal range: 0-35 U/L) and AST 123 U/L (normal range: 14-36 U/L), leading to diagnosis of non-serious Grade **3** alanine aminotransferase increased and Grade 2 aspartate aminotransferase increased (non-serious, related to atezolizumab). Relevant laboratory work-up is reported in the table below. She received treatment with prednisone. On Study Day 147, the events of alanine aminotransferase increased and aspartate aminotransferase increased were considered resolved.

Due to the event of alanine aminotransferase increased, there was no change in study treatment with ipatasertib and paclitaxel, however, study treatment with atezolizumab was interrupted on Study Day 129 and was resumed on Study Day 170.

The Investigator considered alanine aminotransferase increased, to be unrelated to ipatasertib and paclitaxel and related to atezolizumab.

Relevant laboratory work-up:

Study Day	**AST** Normal range: 14-36 U/L	**ALT** Normal range: 0-35 U/L	**Bilirubin** Normal range: 0-1.3 mg/dL	**ALP** Normal range: 38-126 U/L
Screening (1)	31	24	0.3	106
142	123	178	0.5	137
148	46	58	0.4	99
156	21	24	0.3	87
170	46	62	0.3	84

256	37	57	0.3	93
263	69	87	0.3	72
277	131	245	0.3	81
281	68	168	0.3	80
283	44	106	—	—
288	35	60	0.6	71
297	25	27	0.4	61

Event 3: Aspartate aminotransferase increased (AST elevation)
Event 4: Alanine aminotransferase increased (ALT elevation; second episode)

Prior to the events of aspartate aminotransferase increased and alanine aminotransferase increased (second episode), the most recent dose of paclitaxel and atezolizumab was administered on Study Day 184 and ipatasertib (300 mg) on Study Day 190.

On Study Day 198, a laboratory work-up showed ALT 340 U/L (normal range: 0-35 U/L) and AST 207 U/L (normal range: 14-36 U/L), leading to diagnosis of asymptomatic non-serious Grade 3 aspartate aminotransferase increased and non-serious Grade 3 alanine aminotransferase increased (second episode). Grade changes for the events of aspartate aminotransferase increased and alanine aminotransferase increased (second episode) were reported in the table below. Relevant laboratory work-up is reported in the table above. She received treatment with prednisone. On Study Day 296, the events of aspartate aminotransferase increased and alanine aminotransferase increased (second episode) were considered resolved.

Due to the events of aspartate aminotransferase increased and alanine aminotransferase increased (second episode), study treatment with paclitaxel was first interrupted on Study Day 233, resumed on Study Day 249, and then later dose was reduced to 65 mg/m^2 on Study Day 288. Treatment with atezolizumab was first interrupted on Study Day 184 and was later permanently discontinued with last dose administered on Study Day 184. Study treatment with ipatasertib was first interrupted on Study Day 204, resumed on Study Day 218, again interrupted on Study Day 232, again resumed on Study Day 249 and later was permanently discontinued with last dose administered on Study Day 269.

The Investigator considered aspartate aminotransferase increased, to be unrelated to ipatasertib and paclitaxel and related to atezolizumab.

The Investigator considered alanine aminotransferase increased (second episode), to be related to ipatasertib, paclitaxel and atezolizumab.

Grade changes for aspartate aminotransferase increased:

Study Day	Grade changes for aspartate aminotransferase increased
200	1
233	3
240	2
263	1
277	2
281	1

Grade changes for alanine aminotransferase increased (second episode):

Study Day	Grade changes for alanine aminotransferase increased (second episode)
204	2
207	1
213	2
218	1
233	3
246	2
249	1
277	3
281	2
288	1

On Study Day 782, the study was permanently discontinued due to other reason (the patient moved to post trial assessment) with last dose of paclitaxel administered on Study Day 753.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304929	Patient number	3089
Demographics:	51-year-old Asian female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) + Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Neuropathy peripheral AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative, left breast cancer (T3N1MX), approximately 4 years and 10 months prior to study entry following left simple mastectomy.

The patient was diagnosed with locally recurrent disease approximately 3 years 4 months prior to the study entry, and on Study Day – 73 the patient was diagnosed with locally advanced unresectable disease with ER/PR negative and HER2 negative in recurrent/metastatic tissue. At screening, sites of disease involvement included lymph nodes (left supraclavicular and right upper jugular), lung (right lower lobe) and soft tissue (left scalene muscle)

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Adjuvant	Epirubicin and cyclophosphamide (4 cycles each)	Approximately 4 years and 8 months prior to the study entry	Approximately 4 years and 6 months prior to the study entry
Cancer therapy	Adjuvant	Paclitaxel (Cycle: unknown)	Approximately 4 years and 6 months prior to the study entry	Approximately 4 years and 3 months prior to the study entry
Cancer therapy	Adjuvant	Docetaxel (4 cycles)	Approximately 3 years and 7 months prior to the study entry	Approximately 3 years prior to the study entry
Radiotherapy	Adjuvant	Left supraclavicular fossa and level III of the axilla (dose: unknown)	Approximately 2 years and 11 months prior to the study entry	Approximately 2 years and 10 months prior to the study entry
Cancer therapy	Adjuvant	Paclitaxel nanoparticle albumin-bound and carboplatin (6 cycles each)	−784	−630

No medical or surgical history and concurrent conditions were reported.

At screening, the patient's ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medication ongoing at Study Day 1 included vitamin D (unspecified).

On Study Day 134, the patient developed Grade 1 neuropathy peripheral (non-serious, related to paclitaxel; symptoms not reported). No treatment was administered for this event.

Event: Neuropathy peripheral (Peripheral neuropathy)

Prior to the event of neuropathy peripheral, the most recent dose of paclitaxel, ipatasertib (400 mg) and atezolizumab was administered on Study Day 176

On Study Day 177, the ongoing event of neuropathy peripheral worsened to Grade 2 (signs and symptoms not reported). No treatment was reported for the event. The event of neuropathy peripheral remained unresolved at the time of study discontinuation.

Due to the event of neuropathy peripheral, there was no change in study treatment with ipatasertib and atezolizumab; however, paclitaxel was permanently discontinued with the last dose administered on Study Day 190.

The Investigator considered neuropathy peripheral to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

On Study Day 475, a radiographic response assessment showed disease progression with new lesions in bone (intrathecal metastases in lumbar spine).

On the same day (Study Day 475), study treatment with atezolizumab and ipatasertib was permanently discontinued due to disease progression with the last dose of atezolizumab administered on Study Day 442 and ipatasertib on Study Day 448. The patient entered into long-term follow-up.

On Study Day 728, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/305629	Patient number	3090
Demographics:	54-year-old American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Categories:	Suspected COVID-19 Death due to AE, SAE, AE leading to study treatment discontinuation, COVID-19 SAE		

A narrative for this patient is available in Section 1.1 Narratives for patients who died due to an adverse event(s).

Study Number/CRTN:	CO40016/304792	Patient number	3091
Demographics:	51-year-old Black or African American female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Categories:	Rash SAE, Grade $\geq$ 3 rash		
Event 2 (PT) Categories:	Hypersensitivity SAE, AE leading to study treatment discontinuation		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304332	Patient number	3094
Demographics:	63-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) + Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event (PT) Category:	Autoimmune hepatitis AE leading to study treatment discontinuation		

The patient was randomized on Study Day 1.

The patient was diagnosed with ductal, moderately differentiated, ER/PR negative and HER2 negative, metastatic left breast cancer (T3N2M1), on Study Day − 51.

At screening, sites of disease involvement included left breast, right lung S3, lymph nodes (left axillary and interpectoral and right conglomerate of lymph nodes in right lung radix)

No past cancer treatments were reported.

The patient′s medical history included hepatitis B and pneumonia. No surgical history was reported. Concurrent conditions included renal cyst and inguinal hernia.

At screening, the patient′s ECOG Performance Status was 1. At screening, hepatitis B surface antigen, anti-hepatitis B core antibody, and anti-hepatitis C antibody were negative.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medications ongoing on Study Day 1 were reported.

Event: Autoimmune hepatitis

Prior to the event of autoimmune hepatitis, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 348 and ipatasertib (300 mg) on Study Day 356.

On Study Day 362, the patient was noted with Grade 2 alanine aminotransferase increased (non-serious, related) and Grade 1 aspartate aminotransferase increased (non-serious, related to ipatasertib and paclitaxel). On Study Day 365, the event of aspartate aminotransferase

increased was considered resolved. On Study Day 368, the event of alanine aminotransferase increased.

Later, on the same day (Study Day 368), a laboratory work-up showed ALT 267 U/L (normal range: 4-36 U/L), AST 189 U/L (normal range: 8-33 U/L), ALP 399.1 U/L (normal range: 53-141 U/L) and bilirubin 12.6 μmol/L (normal range: 4.27-20.52 μmol/L). The patient was diagnosed with non-serious Grade 3 autoimmune hepatitis. Treatment for the event included methylprednisolone. On Study Day 378, the event of autoimmune hepatitis was considered resolved.

Relevant laboratory work-up:

Study Day	**AST** Normal range : 8-33 U/L	**ALT** Normal range : 4-36 U/L	**Bilirubin** Normal range: 4.27-20.52 μmol/L	**ALP** Normal range: 53-141 U/L	**LDH** Normal range: 225-450 U/L
Screening	16	16	13.4	85.3	484
362	92	97	13	295	482
368	189	267	12.6	399.1	524
371	36	102	11.8	267	358
378	20	39	11	169	390

Due to the event of autoimmune hepatitis, the study treatment with paclitaxel and ipatasertib was interrupted after Study Day 348 and Study Day 356 respectively. The next dose of paclitaxel was given on Study Day 413 and ipatasertib on Study Day 420. Treatment with atezolizumab was permanently discontinued with the last dose administered on Study Day 348.

The Investigator considered autoimmune hepatitis to be unrelated to paclitaxel and ipatasertib and related to atezolizumab and concurrent illness.

On Study Day 441, a radiographic response assessment showed disease progression with new lesions in liver (segment 6).

On Study Day 454, study treatment with ipatasertib and paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel administered on Study Day 434 and ipatasertib on Study Day 440. The patient entered into long-term follow-up.

On Study Day 950, the patient was permanently discontinued from the study as LTFU was terminated by Sponsor.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious/Non-serious**	**Onset day**	**Resolution day / Outcome**	**Causality** (Ipatasertib)	**Causality** (Paclitaxel)	**Causality** (Atezolizumab)

Study Number/CRTN:	CO40016/318813	Patient number	3101
Demographics:	38-year-old American Indian or Alaska Native female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) + Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Categories:	Aspartate aminotransferase increased AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Categories:	Blood alkaline phosphatase increased AE leading to study treatment discontinuation, AESI: Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ″other″ moderately differentiated, ER/PR negative and HER2 negative right breast cancer (T3N1M0), approximately 3 years prior to study entry.

On Study Day −49, the patient was diagnosed with metastatic disease with ER/PR status unknown and HER2 status not assessed in metastatic tissue. At screening, sites of disease involvement included lymph nodes (midline retroperitoneum, midline upper pretracheal and left cervical IV), lung (left upper lobe), bilateral ovarian tumor and pelvis (left acetabulum).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Carboplatin and docetaxel (6 cycles each)	Approximately 2 years and 11 months prior to the study entry	−921
Surgery	Curative	Right breast modified radical mastectomy and right lymph node axillary dissection	−874	NA
Radiotherapy	Adjuvant	Right breast (dose: unknown, 25 fractions)	−826	−794

No medical or surgical history and concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medications ongoing on Study Day 1 were reported.

Event 1: Alanine aminotransferase increased
Event 2: Aspartate aminotransferase increased
Event 3: Blood alkaline phosphatase increased (alkaline phosphatase increased)

Prior to the events of alanine aminotransferase increased, aspartate aminotransferase increased, and blood alkaline phosphatase increased, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 29 and ipatasertib (400 mg) on Study Day 35.

On Study Day 36, the patient was noted with non-serious Grade 3 events of alanine aminotransferase increased, aspartate aminotransferase increased, and blood alkaline phosphatase increased with ALT 340 U/L, AST 192 U/L and ALP 701 U/L. On Study Day 39, the event of aspartate aminotransferase increased improved to Grade 2. On Study Day 43, the event of blood alkaline phosphatase increased improved to Grade 2 and alanine aminotransferase increased improved to Grade 1. No treatment was given for these events. On Study Day 43, the event of aspartate aminotransferase increased was considered resolved. On

Study Day 50, alanine aminotransferase increased was considered resolved. On Study Day 150, blood alkaline phosphatase increased was considered resolved.

Relevant chemistry work-up:

Study Day	**AST** Normal range: 0-32 U/L	**ALT** Normal range: 0-33 U/L	**ALP** Normal range: 35-104 U/L	**Bilirubin** Normal range: 0.1-1 mg/dL
Screening	16	11	102	0.28

141	23	12	109	0.27
150	22	12	98	0.24

There was no change in the study treatment with paclitaxel due to the event of blood alkaline phosphatase increased; however, due to the events of alanine aminotransferase increased, aspartate aminotransferase increased, Cycle 2 Day of paclitaxel was not administered and the next dose was given on Study Day 51.

Due to the events of alanine aminotransferase increased, aspartate aminotransferase increased, and blood alkaline phosphatase increased, study treatment with atezolizumab and ipatasertib was permanently discontinued with the last dose administered on Study Day 29 and Study Day 35 respectively.

The Investigator considered alanine aminotransferase increased and aspartate aminotransferase increased, to be related to ipatasertib and atezolizumab and unrelated to paclitaxel.

The Investigator considered blood alkaline phosphatase increased, to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

On Study Day 145, a radiographic response assessment showed disease progression with new lesions in lymph node (midline para-aortic).

On Study Day 150, study treatment with paclitaxel was permanently discontinued due to disease progression with the last dose of paclitaxel given on Study Day 142. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Cisplatin and gemcitabine (3 cycles each)	151	219
Radiotherapy to left acetabulum bone (dose: 7000 cGy, 7 fractions)	166	172
Capecitabine (2 cycles)	232	267
Doxorubicin and cyclophosphamide (4 cycles each)	270	334

On Study Day 366, the patient died due to COVID-19 infection. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day/ Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Pain in extremity	1	Non-serious	114	140	Unrelated	Unrelated	Unrelated
Hypercalcemia	2	Non-serious	141	Unresolved	NA	Unrelated	NA

Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea
Event 2 (PT) Category:	Diarrhea (second episode) Grade ≥ 3 diarrhea
Event 3 (PT) Category:	Hyperglycemia Grade ≥ 3 hyperglycemia
Event 4 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER2 negative, locally advanced unresectable right breast cancer (T3N1M0) on Study Day − 62.

At screening sites of disease involvement included breast (right lateral upper quadrant and right skin thickening) and lymph nodes (right axillary).

No past cancer treatments were reported.

No medical or surgical history was reported. The patient′s concurrent conditions included constipation, hypertension, glaucoma, rhinitis allergic, intervertebral disc protrusion and epilepsy.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medications ongoing at Study Day 1 included losartan, acetylsalicylic acid, carbamazepine, hydrochlorothiazide, and lamotrigine.

The patient received loperamide prophylactically (total daily dose: 4 mg, PO) for diarrhea from Study Day 1 to Study Day 15.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient experienced non-serious Grade 3 diarrhea. No diagnostic test was reported. Treatment with loperamide was maintained (details in the table below). On Study Day 12, the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	15
Diarrhea	8	PO	16	19
Diarrhea	12	PO	20	20
Diarrhea	4	PO	21	21
Diarrhea	4	PO	29	35
Diarrhea	4	PO	37	38
Diarrhea	2	PO	39	40
Diarrhea	2	PO	42	44
Diarrhea	2	PO	46	47
Diarrhea	2	PO	58	68
Diarrhea	2	PO	70	71
Diarrhea	4	PO	74	74
Diarrhea	2	PO	76	76
Diarrhea	4	PO	93	94
Diarrhea	4	PO	96	100
Diarrhea	4	PO	103	104
Diarrhea	4	PO	115	124
Diarrhea	4	PO	126	126
Diarrhea	4	PO	128	130
Diarrhea	4	PO	143	144
Diarrhea	4	PO	146	146
Diarrhea	4	PO	148	149

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea, to be related to ipatasertib, and unrelated to paclitaxel and atezolizumab.

On Study Day 13, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). Treatment with loperamide was maintained (details in the table above).

Event 2: Diarrhea (Grade 3; second episode)

Prior to the event of diarrhea (second Grade 3 episode), the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8 and ipatasertib (400 mg) on Study Day 14.

On Study Day 15, the ongoing event of diarrhea worsened to non-serious Grade 3. No diagnostic test was reported. Treatment with loperamide was maintained (details in the table above). On Study Day 19, the event of Grade 3 diarrhea improved to Grade 2.

There was no change in study treatment due to the event of diarrhea.

The Investigator considered diarrhea, to be related to ipatasertib, and unrelated to paclitaxel and atezolizumab.

On Study Day 44, the Grade 2event of diarrhea was considered resolved.

Event 3: Hyperglycemia

Prior to the event of hyperglycemia, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 114 and ipatasertib (400 mg) on Study Day 119.

On Study Day 120, the patient′s laboratory work-up showed blood glucose: 408 mg/dL (normal range: 70-99 mg/dL) and she was diagnosed with non-serious Grade 2 (initial intensity) hyperglycemia. Hyperglycemia grade changes are reported in the table below. She received treatment with metformin (details in the table below). On Study Day 169, the event of hyperglycemia was considered resolved.

Due to the event of hyperglycemia, there was no change in study treatment with paclitaxel and atezolizumab, however, study treatment ipatasertib dose was reduced to 300 mg on Study Day 142.

The Investigator considered hyperglycemia, to be related to ipatasertib, paclitaxel and atezolizumab.

Hyperglycemia grade changes:

Study Day	Hyperglycemia grade changes
142	1
148	2
155	3
169	1

Hyperglycemia treatment details:

Treatment	Indication	Dose (Units: mg)	Route	Frequency	Start day	Stop day
Metformin	Hyperglycemia	850	PO	BID	121	Ongoing

Relevant laboratory work-up:

Study Day	Glucose Normal range: 70-99 mg/dL)	HbA1c Normal range: 4-5.7%
Screening (−9)	89	5.5
120	408	—
127	327	—
141	153	—
142	—	9.3
148	191	—
155	257	—
169	90	7.6

Event 4: Alanine aminotransferase increased (Increased ALT)

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 142 and ipatasertib (300 mg) on Study Day 147.

On Study Day 148, the patient′s laboratory work-up showed AST 104 U/L (normal range 5-34 U/L), ALT 247.0 U/L (normal range 8-42 U/L), total bilirubin 1.45 mg/dL (normal range: 0-1 mg/dL) and ALP 186.0 U/L (normal range: 30-105 U/L) leading to diagnosis of non-serious Grade 3 (initial intensity) alanine aminotransferase increased, Grade 1 aspartate aminotransferase increased, Grade 1 blood alkaline phosphatase increased, and Grade 1 blood bilirubin increased (all non-serious, related). Relevant laboratory work-up is reported in the table below. Unspecified treatment was administered for the events of alanine aminotransferase increased and aspartate aminotransferase increased. On Study Day 155, the events of aspartate aminotransferase increased, and blood bilirubin increased were considered resolved. On Study Day 169, the event of blood alkaline phosphatase increased was considered resolved. The event of alanine aminotransferase increased was resolving at the time of study discontinuation.

Alanine aminotransferase increased grade changes:

Study Day	Alanine aminotransferase increased grade changes
155	2
169	1
176	3
183	1
197	2
211	1

Relevant laboratory work-up:

Study Day	**AST** Normal range 5-34 U/L	**ALT** Normal range 8-42 U/L	**Total bilirubin** Normal range: 0-1 mg/dL	**ALP** Normal range: 30-105 U/L
Screening (– 9)	27.0	42.0	0.59	83.0

183	18.0	71	1.07	138.0
197	36.0	126.0	1.14	124.0
211	52.0	55.0	0.81	135.0

Due to the event of alanine aminotransferase increased, there was no change in study treatment with paclitaxel and atezolizumab, however, study treatment with ipatasertib was interrupted on Study Day 149 and was resumed on Study Day 170.

The Investigator considered alanine aminotransferase increased, to be related to ipatasertib, paclitaxel and atezolizumab.

On Study Day 176, the patient was noted with Grade 1 blood alkaline phosphate increased, Grade 1 aspartate aminotransferase increased, and Grade 1 blood bilirubin increased (all non-serious, unrelated; lab work up in the table above). On Study Day 183, the event of aspartate aminotransferase increased was considered resolved. On Study Day 211, the event of blood bilirubin was considered resolved. The event of blood alkaline phosphate increased was resolving at the time of study discontinuation.

On Study Day 188, a radiographic response assessment showed disease progression with new lesions in right breast (right side top square and right side upper square quadrant, injury flow).

On Study Day 213, study treatment was permanently discontinued due to disease progression with last dose of paclitaxel and atezolizumab administered on Study Day 184 and ipatasertib on Study Day 190. The patient entered into long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
'Other' curative surgery of right breast	234	NA
Radiotherapy to breast (right breast and supraclavicular fossa) (dose: 5000 cGy and 200 fractions)	275	324

On Study Day 395, the patient lost to follow-up.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)

Event 5 (PT) Category:	Skin infection SAE
Event 6 (PT) Category:	Vomiting SAE
Event 7 (PT) Categories:	Alanine aminotransferase increased SAE, Grade ≥ 3 hepatotoxicity
Event 8 (PT) Categories:	Aspartate aminotransferase increased SAE, Grade ≥ 3 hepatotoxicity

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304784	Patient number	3005
Demographics:	45-year-old White female		
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, histological grade unknown, ER/PR negative and HER2 negative left breast cancer (TXNXM1) on Study Day − 85.

At screening sites of disease involvement included lymph node (left supraclavicular, left axillary enlargement and right supraclavicular) and left breast quadrants.

No past cancer treatments are reported.

The patient′s medical history included constipation. No surgical history was reported. Concurrent conditions included hypertension, anxiety, abdominal pain upper, hypothyroidism, headache, left breast pain, abdominal pain, hepatomegaly, and hepatic steatosis.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included fluoxetine, levothyroxine, Olmesartan, hydrochlorothiazide, tramadol and metamizole.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 1 and ipatasertib (400 mg) on Study Day 6.

On Study Day 6, the patient experienced first episode of non-serious Grade 1 diarrhea. On the following day (Study Day 7), the event of diarrhea worsened to Grade 3. She received treatment with loperamide (details reported in the table below). On Study Day 9, the event of diarrhea improved to Grade 2. On Study Day 11, diarrhea was improved to Grade 1. On Study Day 12, the first episode of diarrhea was considered resolved.

Due to the event of diarrhea, there was no change in the study treatment with atezolizumab and paclitaxel. However, study treatment with ipatasertib was interrupted on Study Day 8 and the next dose was administered on Study Day 29 at a reduced dose of 300 mg from 400 mg.

The Investigator considered diarrhea to be unrelated to paclitaxel and atezolizumab and related to ipatasertib and other causes (unspecified).

On Study Day 46, the patient experienced Grade 2 diarrhea (non-serious, related to ipatasertib). She received treatment with loperamide. On the following day (Study Day 47), the event of diarrhea was considered resolved.

On Study Day 66, the patient experienced another episode of Grade 2 diarrhea (non-serious, unrelated). She received treatment with loperamide. On Study Day 68, diarrhea was considered resolved.

Event 2: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 58, paclitaxel on Study Day 65 and ipatasertib (300 mg) on Study Day 71.

On Study Day 70, the patient experienced non-serious Grade 2 diarrhea. On Study Day 71, the event pf diarrhea worsened to Grade 3. She received treatment with loperamide. On Study Day 72, the event of diarrhea improved to Grade 1 and later on the same day (Study Day 72), the event of diarrhea was considered resolved.

Loperamide details:

Indication	Loperamide daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	Loperamide	PO	7	12
Diarrhea	Loperamide	PO	46	47
Diarrhea	Loperamide	PO	66	67
Diarrhea	Loperamide	PO	68	68
Diarrhea	Loperamide	PO	70	70
Diarrhea	Loperamide	PO	71	71
Diarrhea	Loperamide	PO	72	72

Due to the event of diarrhea, study treatment with atezolizumab was interrupted on Study Day 58, paclitaxel on Study Day 65 and ipatasertib on Study Day 71 and later never resumed due to disease progression (see narrative below).

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel and atezolizumab.

On Study Day 115, an overall response assessment showed disease progression with new lesions in bilateral sparse hypo vascular nodules and bone minor oval lesions on lumbar vertebral bodies and right iliac bone.

Study treatment was permanently discontinued due to disease progression with the last dose atezolizumab administered on Study Day 58, paclitaxel on Study Day 65 and ipatasertib on Study Day 71. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Cyclophosphamide and doxorubicin (6 cycles each)	124	213
Surgery for left breast	324	—
Left plastron breast and left supraclavicular fossa (dose: 30 cGy, 10 fractions)	399	412
Brain (dose: 30 cGy, 10 fractions)	409	412
Gemcitabine and carboplatin (single cycle each)	444	444

On Study Day 455, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Erythema	2	Non-serious	1	1	Unrelated	Unrelated	Related

Cohort:	Cohort C		
Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was diagnosed with tubular, poorly differentiated, ER/PR and HER 2 negative, metastatic, locally advanced unresectable left breast cancer (T4dN3M0) on Study Day -64.

At screening sites of disease involvement included left breast and lymph node (left axillary and left retro pectoral).

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Radiotherapy	Other	Left breast (20 cGy, 5 fractions)	-30	-14

The patient's medical history included lymphocyte count decreased, amylase increased, Grade 1 hypocalcemia and tumor hemorrhage. No surgical history was reported. Concurrent conditions included hypothyroidism and anemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab. On the same day (Study Day 1), she started loperamide prophylactically (total daily dose: 4 mg, details in the table below).

No concomitant medication ongoing at Study Day 1 was reported.

The patient experienced multiple non-serious events of diarrhea (details in the AEs table below) from Study Day 6 to Study Day 74 and she received loperamide for these events (details in the AE table below).

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 71 and ipatasertib (400 mg) on Study Day 74.

On Study Day 75, the patient experienced non-serious Grade 3 diarrhea. No laboratory test was performed. She received treatment with loperamide (details in the table below). On the same day (Study Day 75), the event of diarrhea was considered resolved.

Due to the event of diarrhea, there was no change in study treatment with atezolizumab, however, study treatment with ipatasertib was first interrupted from Study Day 75 to Study Day 78, and later was reduced to 300 mg on Study Day 85.

The Investigator considered diarrhea to be related to ipatasertib and atezolizumab and unrelated to paclitaxel.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	136

On Study Day 190, study treatment was permanently discontinued as per physician′s decision (the patient responded to the study treatment but after re-evaluation she was eligible for breast surgery) with the last dose of paclitaxel and atezolizumab administered on Study Day 155 and ipatasertib on Study Day 161. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Unspecified curative surgery of right 'other'	196	NA
Capecitabine	266	482
Radiotherapy to right chest (breast) (dose: 180 cGy and 25 fractions)	302	345

On Study Day 828, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/304787	Patient number	3034
Demographics:	46-year-old female (Unknown race)		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 2 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		
Event 3 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T3N0M0), on Study Day − 204.

The patient was diagnosed with metastatic disease on an unknown day with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included left breast (lateral upper quadrant).

No past cancer treatment was reported.

No medical/surgical history was reported. No concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event 1: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 198, paclitaxel on Study Day 205 and ipatasertib (400 mg) on Study Day 207.

On Study Day 208, the patient experienced non-serious Grade 3 diarrhea. She received treatment with loperamide. On Study Day 211, the event of diarrhea was considered resolved.

There was no change in the study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to atezolizumab, paclitaxel and ipatasertib.

Event 2: Diarrhea

Prior to the second Grade 3 event of diarrhea, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 212 and ipatasertib (400 mg) on Study Day 213.

On Study Day 214, the patient experienced Grade 3 diarrhea. She experienced approximately 8 episodes of diarrhea and received treatment with loperamide. On Study Day 218, the event of diarrhea was considered resolved.

There was no change in the study treatment with atezolizumab and paclitaxel due to this event; however, study treatment with ipatasertib was reduced from 400 mg to 300 mg on Study Day 226.

The Investigator considered event of diarrhea to be related to atezolizumab, paclitaxel and ipatasertib.

On Study Day 371, the patient experienced Grade 1 diarrhea (non-serious, related). On Study Day 372, the event of diarrhea worsened to Grade 2. She received treatment with loperamide. On Study Day 378, the event of diarrhea was considered resolved.

Event 3: Diarrhea

Prior to the third Grade 3 event of diarrhea, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 422 and ipatasertib (300 mg) on Study Day 424.

On Study Day 425, the patient experienced non-serious Grade 1 diarrhea. On Study Day 433, the event of diarrhea worsened to Grade 3. She was oriented to maintain anti-diarrheal diet,

water intake and received treatment with loperamide. On Study Day 441, the event of diarrhea was considered resolved.

Loperamide details:

Indication	Loperamide daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	2	13
Diarrhea	4	PO	15	27
Diarrhea	4	PO	30	51
Diarrhea	4	PO	71	85
Diarrhea	4	PO	90	106
Diarrhea	4	PO	114	115
Diarrhea	4	PO	119	122
Diarrhea	4	PO	125	126
Diarrhea	4	PO	128	128
Diarrhea	16	PO	208	211
Diarrhea	4	PO	212	212
Diarrhea	4	PO	214	220
Diarrhea	4	PO	371	372
Diarrhea	4	PO	374	378
Diarrhea	8	PO	425	450

Due to the event of diarrhea, Cycle 16 Day 15 and Cycle 17 Day 1 of paclitaxel and atezolizumab was not administered, and study treatment with ipatasertib was interrupted on Study Day 436. The next dose of paclitaxel and ipatasertib was given on Study Day 457 and atezolizumab on Study Day 464.

The Investigator considered event of diarrhea to be related to atezolizumab, paclitaxel and ipatasertib.

On Study Day 611, study treatment was permanently discontinued as per physician′s decision (due to low adherence to the protocol and the patient's desire to interrupt treatment) with the last dose of paclitaxel and atezolizumab given on Study Day 562 and ipatasertib on Study Day 582. The patient entered into the long-term follow-up.

On Study Day 797, the patient was discontinued from the study as study was terminated by the Sponsor.

Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with mucinous, ER/PR negative and HER2 negative left breast cancer (T4bN1M1) on Study Day − 43.

At screening, sites of disease involvement included liver (right lobe liver, segment VII and segment VIII), breast left (peri areolar thickening of the skin), and liver (segment V, transition between segments VII and VIII and segment VI).

No past cancer treatments are reported.

No medical/surgical history was reported. No concurrent conditions were reported.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, atezolizumab and paclitaxel.

Concomitant medications ongoing at Study Day 1 included zolpidem and escitalopram.

Prior to the event of diarrhea, the patient was noted with multiple events of diarrhea (please refer to table below for details). She received treatment with loperamide.

Event	Most extreme grade	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Diarrhea	1	38	41	Related	Related	Related
Diarrhea	2	42	43	Related	Unrelated	Unrelated
Diarrhea	2	50	50	Related	Unrelated	Unrelated
Diarrhea	2	72	72	Related	Unrelated	Unrelated
Diarrhea	2	76	77	Related	Unrelated	Unrelated

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 86, paclitaxel on Study Day 93 and ipatasertib (400 mg) on Study Day 97.

On Study Day 98, the patient experienced non-serious Grade 3 diarrhea. Grade change during the event course is reported in the table below. She received treatment with loperamide. On Study Day 107, the event of diarrhea was considered resolved.

Loperamide details:

Indication	Loperamide daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	Loperamide	PO	2	4
Diarrhea	Loperamide	PO	8	28
Diarrhea	Loperamide	PO	32	44
Diarrhea	Loperamide	PO	46	46
Diarrhea	Loperamide	PO	72	77
Diarrhea	Loperamide	PO	79	79
Diarrhea	Loperamide	PO	87	87
Diarrhea	Loperamide	PO	98	107
Diarrhea	Loperamide	PO	98	98
Diarrhea	Loperamide	PO	101	106
Diarrhea	Loperamide	PO	143	163

Relevant grade changes reported in the table below:

Event	Study Day	Grade change
Diarrhea	99	2
Diarrhea	106	3
Diarrhea	107	2

There was no change in the study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to atezolizumab, paclitaxel and ipatasertib.

On Study Day 132, a radiographic response assessment showed disease progression with new lesion in bone (lytic lesion in T4 and T5, L1 and right iliac wing, dorsal 5, 6 E 11 E, and low back 1).

On Study Day 213, study treatment with ipatasertib, atezolizumab, paclitaxel and was permanently discontinued due to disease progression with the last dose of ipatasertib administered on Study Day 171, atezolizumab, and paclitaxel on Study Day 185. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Capecitabine and zoledronic acid	210	Ongoing
Radiotherapy (thoracic and lumbar spine) (dose: 2000 cGy; 5 fractions)	279	287

On Study Day 790, the patient was discontinued from the study as study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Infusion related reaction	1	Non-serious	1	1	Unrelated	Related	Unrelated
Diarrhea	2	Non-serious	144	145	Related	Related	Related
Diarrhea	2	Non-serious	148	156	Related	Related	Related
Diarrhea	1	Non-serious	180	183	Related	Unrelated	Unrelated

Event 4 (PT) Categories:	Pneumonitis SAE, AE leading to study treatment discontinuation, Grade ≥ 2 pneumonitis		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/318146	Patient number	3049
Demographics:	34-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative right breast cancer (T3N0M0), approximately 2 years and 4 months, prior to study entry.

The patient was diagnosed with metastatic disease on Study Day − 58 with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included liver (nodule in segment VI and other nodules) and lymph node (enlargement in hepatic hilo).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Doxorubicin and cyclophosphamide (4 cycles each)	Approximately 2 years and 3 months prior to study entry	Approximately 2 years and 1 months prior to study entry
Cancer therapy	Neoadjuvant	Paclitaxel (12 cycles)	Approximately 2 years prior to study entry	Approximately 1 years and 10 months prior to study entry
Surgery	Curative	Right radical mastectomy and right axillary dissection	Approximately 1 years and 8 months prior to study entry	−
Cancer therapy	Adjuvant	Capecitabine (6 cycles)	Approximately 1 years and 7 months prior to study entry	Approximately 1 years and 2 months prior to study entry
Radiotherapy	Adjuvant	Breast and supraclavicular fossa (dose: 50 cGy; 28 fractions)	Approximately 1 years and 6 months prior to study entry	Approximately 1 years and 4 months prior to study entry

The patient′s medical history included appendicitis. No surgical history was reported. Concurrent conditions included depression, abdominal pain upper and insomnia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

Concomitant medications ongoing at Study Day 1 included zolpidem, sertraline, metamizole and gabapentin.

On Study Day 68, the patient was diagnosed with Grade 1 diarrhea (non-serious, related to ipatasertib). No treatment was reported for this event. Later, on the same day, the event of diarrhea was considered resolved.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 97 and ipatasertib (400 mg) on Study Day 104.

On Study Day 105, the patient was diagnosed with non-serious Grade 3 diarrhea. Unspecified treatment was given for the event. Later, on the same day (Study Day 105), the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	2	5
Diarrhea	4	PO	6	20
Diarrhea	2	PO	27	27
Diarrhea	6	PO	30	30
Diarrhea	4	PO	31	31
Diarrhea	14	PO	32	32
Diarrhea	4	PO	33	35
Diarrhea	4	PO	37	37
Diarrhea	4	PO	39	39
Diarrhea	4	PO	41	41
Diarrhea	4	PO	44	44
Diarrhea	4	PO	46	47

There was no change in the study treatment due to the event of diarrhea.

The Investigator considered diarrhea to be related to ipatasertib and unrelated to paclitaxel and to atezolizumab.

On Study Day 96, a radiographic response assessment showed disease progression with new lesion in bone (T8 vertebrae).

On Study Day 111, study treatment was permanently discontinued due to disease progression with the last dose of paclitaxel and atezolizumab given on Study Day 97 and ipatasertib on Study Day 104. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	Start Day	Stop Day
Gemcitabine and cisplatin	120	Ongoing

On Study Day 480, the patient was lost to follow-up.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Atezolizumab)	Causality (Paclitaxel)
Nausea	1	Non-serious	3	13	Related	Related	Related

Study Number/CRTN:	CO40016/304787	Patient number	3096

Demographics:	53-year-old White female
Study treatment (Dosage Regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)
Cohort:	Cohort C
Event (PT) Category:	Diarrhea Grade ≥ 3 diarrhea

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated ER/PR negative, and HER2 negative advanced unresectable metastatic left breast cancer (T4bN2M1) on Study Day − 23.

At screening sites of disease involvement included left breast (skin thickening and side quadrant), lymph node (left medial axillary), and lung (right apical segment).

No past cancer treatment was reported.

No medical history/surgical history was reported. No concurrent condition was reported.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

Event: Diarrhea

Prior to the event of diarrhea, the most recent dose of atezolizumab was administered on Study Day 281, paclitaxel on Study Day 288, and ipatasertib on Study Day 291 (400 mg).

On Study Day 292, the patient experienced non-serious Grade 3 diarrhea. No relevant diagnostic test was performed. No treatment was given for the event. Later, on the same day (Study Day 292), the event of diarrhea was considered resolved.

Loperamide treatment details:

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	4	PO	1	39
Diarrhea	2	PO	41	49

Indication	Total daily dose (Units: mg)	Route	Start day	Stop day
Diarrhea	2	PO	57	57
Diarrhea	2	PO	85	91
Diarrhea	4	PO	92	105
Diarrhea	2	PO	113	133
Diarrhea	2	PO	141	161
Diarrhea	2	PO	169	189

Due to the event of diarrhea, there was no change in the study treatment with atezolizumab and paclitaxel; however treatment with ipatasertib was interrupted after Study Day 291 and was later never resumed due to symptomatic deterioration (see narrative below).

The Investigator considered diarrhea to be related to atezolizumab, ipatasertib and paclitaxel.

On Study Day 316, symptomatic deterioration assessment showed clinical progression in left breast lesion.

On Study Day 323, study treatment was permanently discontinued due to symptomatic deterioration with the last dose of ipatasertib administered on Study Day 291, paclitaxel, and atezolizumab on Study Day 295. The patient then entered the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Surgery (Tumor related orthopedic intervention)	456	NA
Surgery (left other)	489	NA

On Study Day 643, the patient was discontinued from the study as long-term follow-up was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious/ Non-serious	Onset day	Resolution day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304663	Patient number	3013
Demographics:	64-year-old female (Race unknown)		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort:	Cohort C		
Event 1 (PT) Category:	Rash (First episode) Grade ≥ 3 rash		
Event 2 (PT)	Rash (Second episode)		

Category:	Grade ≥ 3 rash

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative, left breast cancer (TXN2MX) on Study Day -105.

On Study Day −71, the patient was diagnosed with locally advanced unresectable disease with ER/PR and HER2 negative. At screening sites of disease involvement included lymph nodes (left axillary node, inferior).

No past cancer treatment was reported.

No medical history or surgical history was reported. Concurrent condition included glaucoma.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

Concomitant medication ongoing at Study Day 1 included latanoprost/timolol.

Event 1: Rash (First episode)

Prior to the event of rash (first episode), the most recent dose of atezolizumab was administered on Study Day 1, paclitaxel on Study Day 8, and ipatasertib (400 mg) on Study Day 10.

On Study Day 11, the patient experienced flare, non-serious Grade 1 (initial intensity) rash and Grade 3 pruritus (non-serious, related to ipatasertib and atezolizumab) spreading over her back. She received treatment with prednisone and betamethasone. On Study Day 28, the event of rash worsened to Grade 3. On Study Day 36, the events of rash and pruritis improved to Grade 1. On Study Day 40, the event of pruritus was considered resolved. On Study Day 55, the event of rash (first episode) was considered resolved.

Due to the event of rash (first episode), study treatment with paclitaxel and atezolizumab was interrupted and the next dose was administered on Study Day 57. Dose of ipatasertib was reduced to 300 mg from 400 mg on Study Day 58.

The Investigator considered rash (first episode), to be related to ipatasertib and atezolizumab, and unrelated to paclitaxel.

Event 2: Rash (Second episode)

Prior to the event of rash (second episode), the most recent dose of atezolizumab and paclitaxel was administered on Study Day 113, and ipatasertib (300 mg) on Study Day 114.

On Study Day 115, the patient experienced itchy non-serious Grade 3 skin rash (second episode, site not specified). She received treatment with prednisone for the event of rash. On Study Day 120, the event of rash improved to Grade 1. On Study Day 127, the event of rash was considered resolved.

Due to the event of rash (second episode), there was no change in study treatment with paclitaxel, however, study treatment with ipatasertib and atezolizumab was interrupted. The next dose of ipatasertib was administered on Study Day 168; however, atezolizumab was never resumed as patient withdrew the consent (see narrative below).

The Investigator considered rash (second episode), to be related to ipatasertib and atezolizumab, and unrelated to paclitaxel.

On Study Day 204, the patient withdrew consent from the study. The last dose of atezolizumab was administered on Study Day 113, paclitaxel on Study Day 169 and ipatasertib on Study Day 175.

Other AEs experienced by the patient during the study:

Event 3 (PT) Category:	Diarrhea Grade ≥3 diarrhea		
Event 4 (PT) Category:	Pyrexia SAE		
Event 5 (PT) Category:	Hypertransaminasaemia SAE		
Event 6 (PT) Category:	Fatigue SAE		

A narrative for this patient is available in Section 1.3 Narratives for patients who experienced serious adverse events.

Study Number/CRTN:	CO40016/304331	Patient number	3031
Demographics:	40-year-old White female		

Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)
Cohort:	Cohort C
Event (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity

The patient was randomized on Study Day −1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR and HER 2 negative, left breast cancer (T2N1M0) on Study Day −581 following biopsy of left breast on the same day.

On Study Day −82, the patient was diagnosed with metastatic disease with ER/PR and HER 2 negative in metastatic tissues. At screening sites of disease involvement included lungs (left subpleural lesion, S7 left side, right lung, S10 and S3) and soft tissue (thickening of skin fold in left breast).

Past cancer treatments are listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Epirubicin, paclitaxel and cyclophosphamide	-558	-452
Surgery	Curative	Radical mastectomy of left breast	-420	NA
Radiotherapy	Adjuvant	Breast (left breast; dose: 5000 cGy and 25 fractions) (tumor bed; 1600 cGy and 8 fractions)	-376	-329

The patient′s medical history included Grade 2 neuropathy peripheral and Grade 1 fibroadenoma of right breast. Surgical history included caesarean section. Concurrent conditions included Grade 2 myopia, Grade 1 radiation fibrosis (left lung), Grade 2 autonomic nervous system imbalance, Grade 1 venous angioma of brain, Grade 1 cholecystitis chronic and Grade 1 goiter.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with ipatasertib, paclitaxel and atezolizumab.

No concomitant medication ongoing at Study Day 1 was reported.

Event: Alanine aminotransferase increased (Increased ALT level)

Prior to the event of alanine aminotransferase increased, the most recent dose of paclitaxel and atezolizumab was administered on Study Day 266 and ipatasertib (400 mg) on Study Day 270.

On Study Day 273, the patient′s laboratory work-up showed ALT 182 U/L (normal range: 4-33 U/L) and AST 87 U/L (normal range: 5-32 U/L). She was diagnosed with non-serious Grade 3 alanine aminotransferase increased and Grade 1 aspartate aminotransferase increased (non-serious, related). She received treatment with ademetionine, arginine citrate/betaine/betaine hydrochloride and polymethylsiloxane polyhydrate. On Study Day 278, the event of alanine aminotransferase increased improved to Grade 1 and the event of aspartate aminotransferase increased was considered resolved. On Study Day 337, the event of alanine aminotransferase increased was considered resolved.

Due to the event of alanine aminotransferase increased, Cycle 11 Day 1 of paclitaxel and atezolizumab was delayed and treatment with ipatasertib was interrupted on Study Day 271. The next dose was administered on Study Day 282.

The Investigator considered alanine aminotransferase increased, to be related to ipatasertib, paclitaxel, atezolizumab and other cause (unspecified).

Study treatment with paclitaxel was permanently discontinued as per physician decision (for patient safety to reduce the risk of minimization) last dose of paclitaxel administered on Study Day 381.

On Study Day 673, a radiographic response assessment showed disease progression with new lesions in left lung (S1).

On Study Day 729, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab and ipatasertib administered on Study Day 659 and Study Day 666, respectively. The patient entered into long term follow-up.

On Study Day 804, the patient was discontinued from the study as long-term follow-up was terminated by the Sponsor.

Study Number/CRTN:	CO40016/304331	Patient number	3043
Demographics:	47-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Alanine aminotransferase increased Grade $\geq$ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with advanced unresectable poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T4N1M0) (histological subtype: other), on Study Day −67 followed by left breast biopsy performed on the same day.

At screening, sites of disease involvement included formation in left breast.

No past cancer treatments were reported.

No medical/surgical history was reported. The patient′s concurrent conditions included renal cyst (left), uterine leiomyoma, ovarian cyst (right) and cholecystitis chronic.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

On Study Day 266, the patient was noted with Grade 1 aspartate aminotransferase increased (AST: 79 U/L; normal range: 0-31 U/L), Grade 2 alanine aminotransferase increased (ALT: 127 U/L; normal range: 0-31 U/L), and Grade 1 blood alkaline phosphatase increased (ALP: 275 U/L normal range: 35-123 U/L) (all non-serious, related to paclitaxel and atezolizumab). She received treatment with ademetionine and calcium chloride/magnesium chloride/potassium chloride/sodium chloride/sodium lactate/sorbitol. On Study Day 273, the events of aspartate aminotransferase increased, and alanine aminotransferase increased were considered resolved. On Study Day 280, the event of blood alkaline phosphatase increased was considered resolved.

Event: Alanine aminotransferase increased (Increased ALT count)

Prior to the event of alanine aminotransferase increased, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 287 and ipatasertib (400 mg) on Study Day 293.

On Study Day 294, a laboratory work-up showed ALT 275 U/L (normal range: 35-123 U/L) and ALP 275 U/L (normal range: 0-31 U/L) and the patient was diagnosed with non-serious Grade 3 alanine aminotransferase increased and Grade 1 blood alkaline phosphatase increased (non-serious, related to paclitaxel and atezolizumab). She received treatment with ademetionine, calcium chloride dihydrate/potassium chloride/sodium chloride/sodium lactate, ascorbic acid and pyridoxine. On Study Day 301, the event of alanine aminotransferase increased was considered resolved. On Study Day 343, the event of blood alkaline phosphatase increased was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 5-31 U/L)	**ALT** (normal range: 0-31 U/L)	**ALP** (normal range: 35-123 U/L)	**Total bilirubin** (normal range: 5-21 μmol/L)
-1	17*	14**	79	10.3@
266	79	127	275	23.9

322	55	40	224	8.2
329	22	36	187	11
343	14	31	112	11.9

*normal range: 5-43 U/L, **normal range: 4-36 U/L, @ normal range: 3.4-20.4 μmol/L

Due to this event, there was no change in the study treatment with atezolizumab and ipatasertib; however, study treatment with paclitaxel was delayed and the next dose was given at a reduced dose of 65 mg/m^2 from 80 mg/m^2 on Study Day 301.

The Investigator considered alanine aminotransferase increased to be unrelated to ipatasertib and related to paclitaxel and atezolizumab.

On Study Day 424, the patient withdrew consent from the study treatment with the last dose of atezolizumab and paclitaxel given on Study Day 413 and ipatasertib on Study Day 419. The patient then entered the long-term follow-up phase.

The patient received follow-up anti-cancer therapy as listed in table below:

Treatments	**Start Day**	**Stop Day**
Radiotherapy to left breast, left axillary area, cervico-supraclavicular, parasternal area (dose:5000 cGy) and tumor bed (dose:6000 cGy)	484	518

On Study Day 785, the patient was discontinued from the study as the study was terminated by the Sponsor.

Other AEs experienced by the patient during the study:

Study Number/CRTN:	CO40016/318813	Patient number	3050
Demographics:	45-year-old White and American Indian or Alaska Native female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day 1.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T3N2aM0) on Study Day – 76.

The patient was diagnosed with metastatic disease on an unknown day with ER /PR negative and HER2 negative disease in metastatic tissue. At screening, sites of disease involvement included lymph node (left axillary and retro pectoral).

No past cancer treatment was reported.

No medical/surgical history was reported. The patient′s concurrent condition included anemia.

At screening, the patient′s ECOG Performance Status was 0.

On Study Day 1, the patient received her first study treatment with ipatasertib, atezolizumab and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

On Study Day 57, a laboratory work-up AST 103 U/L (normal range: 0-32 U/L) and ALT 148 U/L (normal range: 0-32 U/L). The patient was diagnosed with Grade 2 aspartate aminotransferase increased and Grade 2 alanine aminotransferase increased (both non-serious, unrelated). No treatment was reported for these events. On Study Day 64, the event of aspartate aminotransferase increased was considered resolved. On Study Day 71, the event of alanine aminotransferase increased was considered resolved.

Event 1: Alanine aminotransferase increased (ALT elevation)

Event 2: Aspartate aminotransferase increased (AST elevation)

Prior to the events of alanine aminotransferase increased and aspartate aminotransferase increased, the most recent dose of atezolizumab and paclitaxel was administered on Study Day 71 and ipatasertib (400 mg) on Study Day 77.

On Study Day 85, Cycle 4 laboratory work-up showed ALT 303 U/L (normal range: 0-33 U/L) and AST 169 U/L (normal range: 0-32 U/L). The patient was diagnosed with non-serious Grade 3 alanine aminotransferase increased and Grade 3 aspartate aminotransferase increased without clinical implications. No treatment was reported for these events. On Study Day 92, the event of aspartate aminotransferase increased was considered resolved. On Study Day 99, the event of alanine aminotransferase increased was considered resolved.

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 0-32 U/L)	**ALT** (normal range: 0-33 U/L)	**ALP** (normal range: 35-104 U/L)	**Total bilirubin** (normal range: 0.1-1 mg/dL)
-10	17	17	127	0.22
57	103	148	165	0.46
64	25	48	148	0.47
71	21	27	119	0.33
85	169	303	193	0.53
92	26	87	140	0.51
99	21	30	117	0.46

There was no change in the study treatment due to the events of alanine aminotransferase increased and aspartate aminotransferase increased.

The Investigator considered alanine aminotransferase increased and aspartate aminotransferase increased to be unrelated to atezolizumab, paclitaxel and ipatasertib and related to other causes (unspecified).

On Study Day 220, an overall response assessment showed disease progression.

On Study Day 246, study treatment was permanently discontinued due to disease progression with the last dose of atezolizumab and paclitaxel given on Study Day 212, and ipatasertib on Study Day 218. The patient entered into the long-term follow-up.

The patient received follow-up anti-cancer therapies as listed in table below:

Treatments	Start Day	Stop Day
Doxorubicin and cyclophosphamide (5 cycles each)	345	Ongoing
Surgery of left breast	679	–

On Study Day 805, the patient died due to disease progression. An autopsy was not performed.

Other AEs experienced by the patient during the study:

Event	Most extreme grade	Serious / non-serious	Onset Day	Resolution Day / Outcome	Causality (Ipatasertib)	Causality (Paclitaxel)	Causality (Atezolizumab)
Epigastric discomfort	1	Non-serious	69	74	Unrelated	Unrelated	Unrelated
Dry mouth	1	Non-serious	69	74	Unrelated	Unrelated	Unrelated
Alanine aminotransferase increased	1	Non-serious	113	120	Unrelated	Unrelated	Unrelated
Aspartate aminotransferase increased	1	Non-serious	113	120	Unrelated	Unrelated	Unrelated
Diarrhea	1	Non-serious	127	130	Unrelated	Unrelated	Unrelated

Study Number/CRTN:	CO40016/304787	Patient number	3052
Demographics:	59-year-old White female		
Study treatment/Dosage Regimen	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840 mg IV D1 and D15 of 28 days cycles)		

Cohort:	Cohort C
Event 1 (PT) Category:	Diarrhea Grade ≥ 3 diarrhea
Event 2 (PT) Category:	Diarrhea (second episode) Grade ≥ 3 diarrhea
Event 3 (PT) Category:	Hyperglycemia Grade ≥ 3 hyperglycemia
Event 4 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity

A narrative for this patient is available in Section 1.6 narratives for patients who experienced Grade ≥ 3 hyperglycemia.

Study Number/CRTN:	CO40016/304787	Patient number	3061
Demographics:	75-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event 1 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 2 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 3 (PT) Category:	Hyperbilirubinemia Grade ≥ 3 hepatotoxicity		
Event 4 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity		
Event 5 (PT) Categories:	Alanine aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity		

Event 6 (PT) Category:	Aspartate aminotransferase increased Grade ≥ 3 hepatotoxicity
Event 7 (PT) Category:	Alanine aminotransferase increased Grade ≥ 3 hepatotoxicity
Event 8 (PT) Categories:	Aspartate aminotransferase increased AE leading to study treatment discontinuation, Grade ≥ 3 hepatotoxicity

A narrative for this patient is available in Section 1.4 Narratives for patients who discontinued study treatment due to an adverse event.

Study Number/CRTN:	CO40016/305948	Patient number	3070
Demographics:	53-year-old White female		
Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m^2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Category:	Blood alkaline phosphatase increased Grade ≥ 3 hepatotoxicity		

The patient was randomized on Study Day – 3.

The patient was initially diagnosed with ductal, poorly differentiated, ER/PR negative and HER2 negative left breast cancer (T3N0M0) approximately 4 years and 5 months prior to study entry followed by left simple mastectomy performed on the same day.

On Study Day – 84, the patient was diagnosed with locally recurrent and metastatic disease with ER/PR negative and HER2 negative in metastatic tissue. At screening, sites of disease involvement included chest (left chest wall tumor mass), lung (left lower lobe lung metastasis and right middle lobe lung metastasis and bilateral), and lymph node (left hilar and left mediastinal).

Past cancer treatment is listed in the table below:

Type of treatment	Therapy Setting/Intent	Treatments details	Start Day	Stop Day
Cancer therapy	Neoadjuvant	Fluorouracil, epirubicin, cyclophosphamide and docetaxel	Approximately 4 years 7 months prior to study entry	Approximately 4 years 5 months prior to study entry

No medical/surgical history was reported. The patient′s concurrent conditions included back pain and arthralgia.

At screening, the patient′s ECOG Performance Status was 1.

On Study Day 1, the patient received her first study treatment with atezolizumab, ipatasertib and paclitaxel.

No concomitant medications ongoing at Study Day 1 was reported.

On Study Day 279, a laboratory work-up showed ALT 126 U/L (normal range: 0-49.99 U/L) and AST 97 U/L (normal range: 0-39.99 U/L). The patient as diagnosed with Grade 1 alanine aminotransferase increased and Grade 2 aspartate aminotransferase increased (both non-serious, related to paclitaxel). No treatment was reported for this event. The events of alanine aminotransferase increased, and aspartate aminotransferase increased remained unresolved at the time of patient′s death (see narrative below).

Event: Blood alkaline phosphatase increased (Elevated alkaline phosphatase)

Prior to the event of blood alkaline phosphatase increased, the most recent dose of atezolizumab was given on Study Day 281, paclitaxel on Study Day 288 and ipatasertib (400 mg) on Study Day 290.

On Study Day 291, the patient was diagnosed with non-serious Grade 3 blood alkaline phosphatase increased (ALP not reported for this day; initial intensity Grade 2). No treatment was reported for this event. On Study Day 293, the event of blood alkaline phosphatase increased was considered resolved with sequelae (unspecified).

Relevant laboratory values listed in the table below:

Study Day	**AST** (normal range: 0-39.99 U/L)	**ALT** (normal range: 0-49.99 U/L)	**ALP** (normal range: 30-150 U/L)	**Total bilirubin** (normal range: 0-20.99 μmol/L)
-16	83	96	126	7
279	97	126	800	6
286	64	95	626	11
293	55	72	705	12
307	75	85	558	6

314	71	91	543	13
321	90	107	695	12
335	99	119	738	6

There was no change in the study treatment due to the event of blood alkaline phosphatase increased.

The Investigator considered blood alkaline phosphatase increased to be related to paclitaxel and unrelated to ipatasertib and atezolizumab.

On Study Day 329, an overall response assessment showed disease progression.

On Study Day 335, the patient was discontinued from the study treatment due to disease progression with the last dose of atezolizumab and paclitaxel was given on Study Day 323 and ipatasertib on Study Day 329. The patient then entered the long-term follow-up.

On Study Day 695, per the death by public records the patient died due to disease progression. No information regarding autopsy was reported.

Other AEs experienced by the patient during the study:

Event	**Most extreme grade**	**Serious / non-serious**	**Onset Day**	**Resolution Day / Outcome**	**Causality (Ipatasertib)**	**Causality (Atezolizumab)**	**Causality (Paclitaxel)**
Diarrhea	1	Non-serious	1	8	Related	Unrelated	Related

Study treatment (Dosage regimen)	Ipatasertib (400 mg PO QD: D1-D21 of 28 days cycle) + Paclitaxel (80 mg/m2 IV weekly: D1, D8 and D15 of 28 days cycle) +Atezolizumab (840mg IV D1 and D15 of 28 days cycles)		
Cohort	Cohort C		
Event (PT) Categories:	Suspected COVID-19 Death due to AE, SAE, AE leading to study treatment discontinuation, COVID-19 SAE		

A narrative for this patient is available in Section 1.1 Narratives for patients who died due to an adverse event(s).

Appendix to CSR: Summary Impact of COVID-19 on Data Collection, Reporting and Analysis

TABLE OF CONTENTS

1. INTRODUCTION

On March 11, 2020, the World Health Organization (WHO) characterized the outbreak of Coronavirus Disease 2019 (COVID-19), caused by the novel coronavirus SARS-CoV-2, as a pandemic. Government restrictions on the population were implemented to varying degrees globally in response to the COVID-19 pandemic. Measures, such as restrictions of movement and travel and, therefore, visits to healthcare facilities, as well as the increased demands on the health service due to the pandemic and changes to study staff availability pose various challenges to the conduct of clinical studies. In addition, participants may have been required to self-isolate, which introduces difficulties for Investigators to maintain their medical oversight. Therefore, the COVID-19 pandemic may have had an impact on the conduct of clinical studies of medical products, on study participants, and on the collection and analysis of clinical study data.

It is difficult to determine the start of the COVID-19 outbreak and the Sponsor decided to use 1 December 2019 based on early cases reported in Mainland China. Study CO40016 began with first patient in (FPI) on 6 January 2018 and the CCOD for the study was 30 October 2021 for efficacy analyses. A snapshot date of 21 March 2023 was utilized for non-efficacy analyses. The last patient last visit (LPLV) for this study took place on 4 January 2023, which included the period during which the COVID-19 pandemic was occurring globally.

At the time of the primary analyses for Cohort A (Report No. 1101889) and Cohort B (Report No. 1100941) the COVID-19 pandemic had a minor impact on the study conduct, study patients, and data collection

The objective of this appendix is to document the impact of the COVID-19 pandemic up until the final snapshot for non-efficacy analyses (21 March 2023) on the study patients, study conduct, data collection and reporting, data analysis, and study results and conclusion. Overall, there has been minimal impact since the initial assessments for Cohort A and Cohort B.

2. METHODOLOGY

2.1 MITIGATION MEASURES IMPLEMENTED

2.1.1 Adjustments in Study Procedures

The Sponsor performed a comprehensive risk assessment to identify and document any specific COVID-19 pandemic risks relating to trial disruption and corresponding mitigation actions, for the defined critical variables (data and processes) of the study, which could ultimately impact patient safety and/or data integrity.

Disruptions as a result of the pandemic, including travel restrictions, quarantine, self-isolation and/or precaution measures, meant that some patients were unable to visit investigational sites for protocol-specified visits and undertake required clinical study

activities, or receive treatment. Alternative methods for assessments (e.g., remote visits, such as via telephone or virtual meetings, alternative location for assessment, including local labs or imaging centers) were initiated and implemented by investigator sites when necessary and feasible. Every effort was made to ensure safety information was reported as per protocol-required timelines, acknowledging that there could be some delays as a result of the pandemic.

Additional general guidance regarding reporting and actions in case of suspected/confirmed COVID-19 infections was also communicated via the Country Study Managers in line with Sponsor company-wide guidance.

No changes were made to the protocol due to the COVID-19 pandemic.

For some cases in which patients were unable to attend sites due to high numbers of positive cases at site clinics, arrangements were made for the IMP to be delivered directly to the patient's home, either by an approved courier service (ipatasertib only) or by qualified trial personnel, to ensure continuity of treatment, according to standard operating procedures (SOPs) and applicable local regulations. This was implemented for 8 patients at 7 sites in France, Peru, Russia, Turkey, and the UK. If, despite best efforts, the dose of study treatment could not be administered as defined in the protocol (see Protocol, Appendix 1 and Appendix 2, Schedule of Activities), this was recorded. If more than 3 doses of paclitaxel and/or 21 days of ipatasertib within any 28-day cycle were missed, this was also documented as a major protocol deviation.

The COVID-19 pandemic did not result in any site closures, but some patients were routed to other locations for patient safety, due to large number of COVID-19 cases at some sites. The patients at these sites attended visits at alternative sites or at home as described below for study assessments and in some cases, preparation and administration of study treatment. Visits, which occurred at alternative sites/patient's home, were documented in source notes. For 2 patients in Cohort A, visits to a medical facility were not feasible and, therefore, to ensure patient safety, remote visits were performed at the patient's home by qualified trial personnel according to SOPs and applicable regulations (refer to major protocol deviations in the final CSR Section 4.3.1). If visits to a site/home were not feasible, then the medical evaluation of safety and disease took place by telemedicine using secure video conferences, phone calls, or a web portal and/or mobile application for communicating with and monitoring the patient's progress.

For any of the mitigating actions mentioned above, the patients were informed of the proposal and any potential risks associated with the specific scenario and signed a revised ICF addendum, if required. Institutional Review Board/Independent Ethics Committee (IRB/IEC) were informed and/or approved of this procedural change.

The trial investigator was responsible for ensuring that the identification, management, and reporting of adverse events (AEs) and serious AEs (SAEs) was completed in accordance with the protocol and applicable regulations. AEs were reported by patients to the investigator/trial team or identified by the trial team during interactions with the patients via telemedicine. In addition, home health nurses may have identified AEs and reported them to the investigator for evaluation. Additional AEs may have been identified from laboratory reports, imaging or electrocardiogram (ECG) reports, or other records of trial procedures that were conducted at alternative locations due to the COVID-19 pandemic. As determined by the investigator, the appropriate medical intervention, therapeutic intervention, and/or support measures were instituted, as necessary.

Per protocol, local laboratories were used for routine monitoring, if needed this could be conducted at local laboratories closer to the patients. The Principal Investigator (PI) would need to do a timely review of the laboratory results to assess AEs and would report them in patients' eCRF. Laboratory certifications and reference ranges of the local labs would need to be collected by the sites. In addition, 2 patients in Cohort A located in Turkey had tumor assessments conducted at alternative imaging centers close to the patient's homes, due to COVID-19 restrictions. In these cases, the new facility was identified by the investigator who informed the Sponsor. In all instances, the alternate location met International Council for Harmonisation Good Clinical Practice/Good Laboratory Practice (ICH GCP/GLP) requirements and was well equipped to perform trial procedures and covered by adequate insurance. The investigator maintained sufficient oversight to ensure that the staff at the alternate location were trained to perform trial procedures.

2.1.2 Monitoring

Risk-based monitoring activities, including remote monitoring activities, were initiated as standard, at the beginning of the study. To mitigate any identified COVID-19 specific risks, that were related to site monitoring activities, the Sponsor evaluated and implemented alternative remote monitoring strategies as necessary, to maintain oversight and ensure the rights, safety and well-being of participants in the study, as well as the integrity of the study and study data.

In most countries and sites (based on-site and/or country policy), on-site monitoring visits were not permitted at some point prior to the final analysis. In these cases, remote monitoring was employed, where permissible per local regulations. Remote monitoring consisted of remote data review (RDR) and remote site contact, such as telephone / email. Where RDR was employed, the Monitor was to ensure data appeared reasonable and logical according to protocol requirements. The Monitor was to check for safety reporting to the Sponsor (and IRB/IEC as required) during the remote contact. If any issues were identified, the Monitor should follow up with the site via telephone conversation or video call. Remote site contact with site staff could help assess that

critical processes were being followed and data obtained. The study management team also evaluated all source data verification (SDV) data fields per the trial monitoring plan (TMP) and tiered all fields in terms of importance for analysis to ensure in case of any resource/time/on-site visit constraints a clear prioritization and to ensure the priority fields were reviewed. As per standard practice, Monitors were also directed to pay specific attention to aspects of site trial management susceptible to the pandemic challenges such as resourcing, investigator oversight, and delegation of duties.

Remote SDV, whereby the Monitor obtained remote access to source data (e.g. via access to Electronic Health Records Systems, video conferencing, or discussed via telephone conference call), could be considered under the COVID-19 pandemic situation. Where on-site monitoring visits could not be conducted per the TMP, this was recorded in the clinical trial management system (CTMS), including the specific reason imposed by COVID-19. These were annotated with the specific tag “COVID-19” in the free-text description field.

At three sites in Peru, monitoring could not be completed on-site or remotely due to institutional rules and regulations. For final analysis, data from these sites underwent centralized monitoring review or RDR, and the monitors followed the Sponsor’s SOP.

2.2 DATA CAPTURE AND REPORTING

For all non-adherence to protocol-specified approaches due to COVID-19 pandemic, a specific protocol deviation was recorded, with an option to report the associated reason imposed by COVID-19 (e.g., Subject Movement Restricted due to Pandemic, Confirmed or Suspected Infection, etc.) and with the specific tag “COVID-19” in the description field. “Confirmed or suspected infection” was utilized if the patient’s infection caused by COVID-19 had been confirmed by a diagnostic test, or a patient had symptoms compatible with COVID-19, that had not been confirmed by a diagnostic test.

The Sponsor’s definition of a protocol deviation (i.e., major vs. minor) remained unchanged during the pandemic (See Section 4.3.1 of CO40016 Final CSR). However, due to the increased likelihood of protocol deviations occurring during the COVID-19 pandemic, the Sponsor study team reassessed, as appropriate, the original protocol deviation classifications in the TMP of major and minor deviations to ensure the changes imposed by COVID-19 were categorized properly. The Protocol Deviation Management System (PDMS) captured all major protocol deviations including the ones which were titled COVID-19, so that protocol deviations caused by COVID-19 pandemic could be consistently reported. After evaluation, the Sponsor considered that, at this time, the categories in place were adequate, and no updates to the protocol deviation classifications in the TMP were deemed necessary.

Safety Data Reporting: See Section 2.1 for mitigation measures to ensure timely reporting of safety information. With the onset of the COVID-19 pandemic (1 December 2019) until the final snapshot for non-efficacy analyses (21 March 2023) being about 3.5

years, the Sponsor considers the additional time taken was sufficient and had made every possible effort during this time to capture delayed reporting of events that occurred prior to CCOD.

In order to assess the impact of COVID-19 illness and the pandemic disruption on the safety reporting, the Sponsor developed safety analyses concepts to capture COVID-19 associated AEs. These are defined in Section 2.3.

2.3 ADDITIONAL ANALYSES PERFORMED

2.3.1 Statistical Considerations

No changes to the Statistical Analysis Plan were made as a result of COVID-19 impact.

2.3.2 Additional Safety Analyses

Based on the first reports of COVID-19 infection globally, the Sponsor determined that the window for all analyses of COVID-19 associated events would start from 1 December 2019, until the final snapshot for non-efficacy analyses (21 March 2023).

The Sponsor utilized the standardized narrow Medical Dictionary for Regulatory Activities (MedDRA) COVID-19 Standard MedDRA Query (SMQ) identified by Maintenance and Support Services Organization (MSSO) to identify AEs of a confirmed or suspected COVID-19 infection. All analyses used the most current version of the SMQ.

The search identified AEs of a confirmed or suspected COVID-19 infection, and for patients with confirmed or suspected COVID-19 infections the following listings were generated as follows:

- A listing of confirmed or suspected COVID-19 AEs
- A listing of patients who died for reasons related to COVID-19 outside per protocol AE reportable window, identified via manual review of the free-text field associated with reason for death as “other”.

In addition, the Sponsor developed a broad search strategy for AEs associated with COVID-19 infection to further evaluate the confirmed events of COVID-19 and reported AEs that could be considered complications of the disease. This search strategy included both the PTs of a confirmed or suspected COVID-19 infection and any AEs considered associated with COVID-19 (temporally reported around PTs for confirmed or suspected COVID-19 infection). As causality to COVID-19 was not collected on the standard eCRFs, the Sponsor identified associated AEs as those reported ≤7 days before and ≤30 days after any reported AE suggesting a confirmed COVID-19 infection.

For patients identified from the search as having COVID-19 associated AEs, listings and tables to evaluate these safety events were produced as follows:

- Listings and tables of COVID-19 Associated Events: including the AEs of a confirmed or suspected COVID-19 infection plus, for those patients with confirmed

COVID-19 infection or positive PCR test, any other AEs occurring within ≤7 days before and ≤30 days after start date of all the confirmed COVID-19 events.

Determining whether the AE led to discontinuations from treatment and/or study relies on the study AE eCRF already containing fields to collect these data. In addition, discontinuations from treatment and/or study due to indirect COVID-19 pandemic-related aspects (e.g., patients leaving the study due to fear of going to the site during the pandemic) were assessed by manual review of the additional information reported on the disposition or study treatment discontinuation eCRF free-text fields.

Patient narratives are included for patients with confirmed/suspected COVID-19 SAEs in the active arm.

3. IMPACT ASSESSMENT

3.1 IMPACT OVERVIEW

The CCOD for the final efficacy and safety analysis for Study CO40016 occurred on 30 October 2021 and 21 March 2023, respectively. The overall impact of COVID-19 on the study was assessed as follows:

- The impact of COVID-19 on study conduct was minor. A low proportion of study visits and/or data collected were impacted by site closures, travel restrictions and requirements for remote activities.
- Contingency measures, which modified the trial conduct and administration of trial procedures, were implemented to allow patients to continue in the trial despite the challenging circumstances (see Section 2.1).
- No protocol or SAP amendment due to COVID-19 was required (up to the CCOD), however, a COVID-19 specific update to the ICF (COVID-19 ICF addendum) was implemented to capture the written consent of any patients needing to implement any mitigation measures as a result of COVID-19 restriction or safety concerns.
- Eight major protocol deviations due to COVID-19 were reported and none of these resulted in missing data (Section 3.4).
- There was no significant impact on data collection for assessment of primary and key secondary efficacy endpoints, as no patient missed two or more efficacy assessments.
- 17 patients with confirmed or suspected COVID-19 were reported (Section 3.6.2).
- Minimal impact on safety analyses, patient safety was monitored and managed, and the safety results still hold scientific validity.

3.2 DISPOSITION

3.2.1 Study Status

When the pandemic disruption occurred, enrollment in the trial was almost complete, and as such, the impact was minimal. The trial was completed despite the disruption that occurred, and the primary and key secondary objectives were achieved.

The study's Independent Data Monitoring Committee (iDMC) continued review of collected safety data at an interval pre-specified in the iDMC's charter.

3.2.2 Patients Discontinued from Treatment Due to Reasons Related to COVID-19 Pandemic

Two patients discontinued from treatment for reasons related to COVID-19 infection or study disruption: one in Cohort B and one in Cohort C (l_ae_COV_A_SE, l_ae_COV_B_SE, l_ae_COV_C_SE).

3.2.3 Patients Discontinued from Study Due to Reasons Related to COVID-19

One patient in Cohort C discontinued from the study for reasons related to COVID-19 infection or study disruption (l_ae_COVAS_SDSC_A_SE, l_ae_COVAS_SDSC_B_SE, l_ae_COVAS_SDSC_C_SE).

3.3 STUDY POPULATION

Because recruitment and last patient in was completed shortly after the pandemic outbreak, analysis of subpopulations based on recruitment measures was not performed.

3.4 PROTOCOL DEVIATIONS

A summary of all major protocol deviations is provided in the final CSR Section 4.3.1, also including a summary of COVID-19 related major protocol deviations. Major protocol deviations related to COVID-19 were reported in 8 patients across all cohorts and are summarized below. No major protocol deviations in laboratory testing and data collection that may have impacted the safety reporting of the study were reported. Overall, COVID-19 pandemic disruption did not impact the frequency or nature of major protocol deviations and did not impact the overall quality of the study or the outcome of the study.

Cohort A

In Cohort A, four major protocol deviations were reported in 4 (1.6%) participants. Two participants missed more than 1 cycle of paclitaxel and 2 participants had study procedures performed at home visits.

Cohort B

In Cohort B, two major protocol deviations were reported in 2 (0.9%) participants, both participants missed more than 1 cycle of study treatment.

Cohort C

In Cohort C, two major protocol deviations were reported in 2 (2%) participants, one participant had study procedures performed at home visits and one participant did not discontinue study treatment per protocol.

A listing of patients who were reported to have major protocol deviations related to COVID-19 pandemic is provided (l_dv_reas_COVDV_A_IT, l_dv_reas_COVDV_B_IT, l_dv_reas_COVDV_C_IT).

3.5 EFFICACY

3.5.1 Exposure

The COVID-19 pandemic disruption led to missed or delayed dosing for some patients. Overall, major protocol deviations were reported for four patients who missed more than 1 cycle of study treatment due to COVID-19 (Section 3.4), which had no impact on efficacy.

3.5.2 Impact of COVID-19 Pandemic on Efficacy Analyses

Missing two consecutive tumor assessments was considered a major protocol deviation, and no deviations related to COVID-19 were reported under this category (l_dv_reas_COVDV_A_IT, l_dv_reas_COVDV_B_IT, l_dv_reas_COVDV_C_IT). As described in Section 2.1.1, the use of alternative imaging centers was implemented as a temporary change and tumor assessments for 2 patients in Cohort A were performed at an alternative center.

Overall, the impact of the COVID-19 pandemic disruption on efficacy analysis was minimal.

3.6 SAFETY

Overall, the COVID-19 pandemic did not significantly impact the ability to monitor and manage patient safety during the conduct of the study. In addition, COVID-19 disruption did not significantly impact the safety results of the study or the safety profile of the study treatment. The observed safety findings from the study are not confounded significantly by the pandemic and remain scientifically valid.

3.6.1 Impact of COVID-19 Pandemic on Adverse Event Reporting

Overall, the COVID-19 pandemic did not significantly impact the ability to monitor and manage patient safety during the conduct of the trial.

3.6.2 Confirmed or Suspected COVID-19 Infection

Seventeen patients (Cohort A, n=9; Cohort B=3; Cohort C, n=5) were reported to have confirmed or suspected COVID-19 infection AEs, as identified by the MedDRA COVID-19 SMQ (l_ae_COV_A_SE, l_ae_COV_B_SE, l_ae_COV_C_SE). See Section 3.6.3.1 below.

Patient narratives are provided for all patients with Confirmed/Suspected COVID-19 SAEs in each cohort (active arm only).

3.6.3 Impact of COVID-19 on Adverse Event Profile

3.6.3.1 Summary of COVID-19 Associated AEs

A total of 17 AEs associated with COVID-19 were reported across the three cohorts: 9 (5.4%) patients in Cohort A (all in the Ipat+Pac arm), 3 patients in Cohort B [2 (1.4%) in the Ipat+Pac arm) and 1 (1.3%) in the Pbo+Pac arm], and 5 (4.9%) patients in Cohort C. (l_ae_COVAS_A_SE, l_ae_COVAS_B_SE, l_ae_COVAS_C_SE, t_ae_COVAS_A_SE, t_ae_COVAS_B_SE, t_ae_COVAS_C_SE). Of these, 2 patients (1 in the Ipat+Pac arm in Cohort B and 1 in Cohort C) discontinued treatment due to confirmed or suspected COVID-19 infection (l_ae_COV_A_SE, l_ae_COV_B_SE, l_ae_COV_C_SE).

3.6.3.2 COVID-19 Associated Adverse Events Leading to Study or Study Treatment Discontinuation

Two patients across all cohorts discontinued study treatment due to COVID-19 associated AE: 1 patient in the Ipat+Pac arm in Cohort B and 1 patient in Cohort C (l_ae_COV_A_SE, l_ae_COV_B_SE, l_ae_COV_C_SE). Of these, the 1 patient in Cohort C also discontinued the study due to Grade 5 AE of suspected COVID-19. This was also assessed as a death related to COVID-19 by the investigator (l_ae_COVAS_SDSC_C_SE, l_dd_C_SE).

3.6.4 Impact of COVID-19 Pandemic on Laboratory Testing

Overall, the COVID-19 pandemic had a minor impact on the laboratory testing with no impact on the study safety results.

The use of local laboratories for hematology and biochemistry testing was implemented in Study CO40016 as part of the protocol schedule of activities. As described in Section 2.1.1, blood work could be conducted at local laboratories closer to the patients, if needed. If an alternate local laboratory was used for safety bloodwork, the results would have then been shared with the PI site. Despite having the laboratory samples collected at patients' homes, the overall laboratory results were not impacted.

4. INTERPRETATION OF FINDINGS

Study CO40016 began on 6 January 2018 (FPI) and ended on 4 January 2023 (LPLV). Before the pandemic, the study was nearly fully enrolled, and the protocol-defined primary analyses were completed soon after the pandemic onset. The CCOD for the study was 30 October 2021 for efficacy analyses. A snapshot date of 21 March 2023 was utilized for non-efficacy analyses. Some additional measures for safety data and protocol deviation collection due to COVID-19 were added to mitigate the impact on the study. Overall, 17 patients (2.96%) had a confirmed or suspected COVID-19 infection (all cohorts) and 8 major protocol deviations due to COVID-19 were reported in 8 patients (1.39%). However, their impact was minimal and did not affect the overall analyses. Despite the pandemic, every effort was made to report the safety events on time and no major safety concerns were observed. Therefore, the overall efficacy and safety data collected from the study still hold scientific validity.

5. CONCLUSION

The COVID-19 pandemic had minor impact on the study conduct and data collection. Data analysis has not been impacted:

- The study protocol or conduct has not been altered.
- The study had minimal missing data.
- The impact on safety data collection was minor. The observed overall safety findings from the study were not confounded by the pandemic, still hold scientific validity and are clinically meaningful.
- The risk/benefit ratio of ipatasertib remains unchanged, as both efficacy and safety results have not been impacted.
